SUMMARY

This is the sixth annual report for the Barrow Creek Project. As such, it details all exploration activity conducted over the project licences during the calendar year for 2003.

The area covered by the Barrow Creek Joint Venture (BCJV), located approximately 300km north of Alice Springs, is being explored for economic gold mineralisation.

During 2003, Newmont re-negotiated an agreement with the NTDBIRD to modify the group reporting arrangement for the Barrow Creek JV exploration licences to cover EL10013 (Antelope) and SEL10038 (Thumper).

On 8/12/2003 the SEL 22042 (Odysseus) was relinquished in full. A final report has been lodged with NTDBIRD but work completed during the year is also covered in this report.

Exploration activities conducted over the reporting period comprised:

EL	BCL	LAG	AC	m	samples
EL10013 (Antelope)	94	35	8	471	163
SEL10038 (Thumper)	53	11	33	1902	662
SEL22042 (Odysseus)	42	22	7	420	145
TOTALS:	189	68	48	2793	970

1 INTRODUCTION

This document is the sixth project group report to be completed for the Barrow Creek JV Project (BCJV). It describes exploration activities associated with exploration licences held by the BCJV, namely EL's 10013, 10038 together with SEL 22042. The document reports on exploration activity covering the period 1st of January 2003 through to the 31st of December 2003 for the respective licences (Table 1).

2 LICENCE DETAILS

Newmont Gold Exploration Pty Ltd (Newmont) and Yuendumu Mining Company NL (YMC) hold the BCJV licences under the terms of the Barrow Creek Joint Venture (BCJV). The tenements are managed by Newmont Exploration. SEL 22042, Odysseus, was part of the BCJV and was relinquished 8/12/2003.

TABLE 1: Tenement Summary for BCJV Exploration Licences

2.1 LOCATION, ACCESS & PHYSIOGRAPHY

Exploration Licences within the BCJV are located approximately 300km north of Alice Springs and between 20 to 75km north to north-west of Barrow Creek.

Access from Barrow Creek is via the Stuart Highway to the north and then using numerous station tracks of variable but generally good quality. The licences are located on the Stirling and Neutral Junction stations (NT Portion 655 & NT POR. 3375 respectively).

The licence is covered by sandy plains with out dunes but vegetated by thick clumps of mulga, (Haines, P.W. et al., 1991). The Hanson River drains the western part of the plains.

The eastern portion of the licence is bordered to the east and west by the northwest/southeast trending Crawford and Osborne Ranges. These ranges are composed of steeply dipping sandstone.

3 HISTORY OF AREA

3.1 PRE-NEWMONT

Exploration at Barrow Creek has historically been largely for base metals, gold and Sn/W/Ta deposits. Within the Crawford, Osborne and Watt Range areas, numerous copper workings can be found, including Home of Bullion and Petricks. The area to the south of the Crawford Range has been the site of the majority of tin, tungsten and tantalum workings, most being small, low tonnage operations.

Kewanee Australia Pty Ltd undertook a broad exploration program between 1970-1974 within the Crawford-Osborne Range area. Several targets were delineated by a combination of airborne magnetics, radiometrics and EM survey techniques. Targets generated by this method were followed up with geological mapping, sampling and a combination of percussion, reverse circulation and diamond drilling. This work delineated a sub-economic Cu-Ni resource (Prospect D), but grade was considered too low to warrant further investigation, and the ground was relinquished in 1973.

Limited exploration was conducted by Australis Mining NL during 1969, for base metal potential in the Crawford Range area. Pegmatites, granites and metadolerites were targeted with disappointing results.

More recently, Aberfoyle Ltd has explored for firstly base metal mineralisation, and thereafter, gold mineralisation in the Home of Bullion area.

3.2 NEWMONT EXPLORATION

Newmont (and its precursor companies) has had an exploration presence in the Barrow Creek area since 1988. Work over this time has included reconnaissance techniques such as soil sampling and vacuum and RAB drilling as well as detailed aeromagnetic/radiometric surveys, regional ground-based gravity surveys and detailed regional regolith mapping.

Detailed prospect evaluation work has also been conducted, including reverse circulation and diamond drilling as well as prospect-based IP surveys.

The gold-mineralised prospects Kroda (8m @ 11.72g/t Au in RC drilling), NW Petricks (6m @ 1.6g/t Au in RC drilling) and Tiptoe (3m at 2.34 g/t in RC drilling) were discovered within the bounds of SEL22042 while the Morphett gold mineralised prospect (several metres at several g/t in RAB drilling) was found within EL7928.

In 1999 although no exploration activities were permitted, an extensive program was undertaken to rehabilitate sites of previous exploration drilling activities. Except for a few diamond holes, PVC collars were cut back below the surface and sealed with concrete plugs.

An independent geological consultant was contracted to provide an approximate resource calculation for the Kroda C5 gold mineralised prospect. As the majority of drilling into the prospect is RAB, the dataset is not of sufficient quality to report to the public. The resource estimate was undertaken in order to give Normandy NFM an independent assessment of the scope and potential of the prospect.

4 GEOLOGY

4.1 REGIONAL GEOLOGY

The oldest exposed basement in central Australia comprises metamorphic and igneous rocks of the Arunta Inlier (Haines et al., 1991). Rocks of the Arunta Inlier are interpreted as being at least partly correlative with sedimentary and volcanic sequences of the adjacent Tennant Creek and Granites-Tanami Inliers.

The Arunta Inlier (Early-Middle Proterozoic) is characterised by metamorphosed sedimentary and igneous rocks of low to medium pressure facies. Deformation and regional metamorphism to upper greenschist facies took place between 1810-1750 Ma (Black, 1981). Shaw and Stewart (1975) established three broad stratigraphic subdivisions based on facies assemblages and lithological correlations. From oldest to youngest, these subdivisions are named Division 1, 2 and 3. Using this model defined by Shaw and Stewart (1975), the orthogneiss east of Osborne Range, the calc-silicate rocks west of Crawford Range and the Bullion Schist would be included in Division 2, and the Ledan Schist in Division 3 of the Arunta Inlier.

Unconformably overlying these rocks are the Hatches Creek Group sediments and volcanics. Blake et al. (1987) formally subdivided the Group into the Ooradidgee, Wauchope and Hanlon Subgroups, comprising a total of 20 Formations and two Members. The Hatches Creek Group is a folded sequence of shallow-water sediments with interbedded volcanic units which reach thicknesses of at least 10,000 metres.

The sediments include ridge-forming quartzites, feldspathic, lithic and minor conglomeratic arenites and friable arenite, siltstone, shale and carbonate. The Ooradidgee Subgroup consists mainly of fluvial sediments and sub-aerial volcanics which partly interfinger. The Wauchope Subgroup is characterised by large volumes of volcanics and sediments probably both marine and fluvial in origin. The Hanlon Subgroup may be entirely marine and lacks volcanics (Blake et al., 1987).

Deformation and regional metamorphism took place between 1810-1750 Ma (Black, 1981). Folding was about NW trending axes while metamorphism to upper greenschist facies took place. Later intrusion of both the Arunta basement and the Hatches Creek Group by granitoids of the Barrow Creek Granitic Complex took place around 1660 Ma (Blake et al., 1987). Contact metamorphism and metasomatism are often observed.

Sedimentation associated with the Georgina Basin commenced during the Late Proterozoic with the Amesbury Quartzite and was terminated during the Early Devonian after deposition of the Dulcie Sandstone. The Georgina Basin sequence was mildly affected by the Carboniferous Alice Springs Orogeny.

A long erosional period followed with subsequent deep weathering during the Tertiary produced silcrete and ferricrete horizons. A veneer of Quaternary sands and soils overlays much of the area, except where recent and active alluvial sedimentation is present.

4.2 LOCAL GEOLOGY

Surface geology within the Barrow Creek project consists of thick cover in wash out areas, however on average there is 2-6m of soil cover. The dominant rock type includes mica-sericite schist, interpreted to be part of the Bullion Schist Formation, along with feldspathic and quartz-rich arenites of the Gwynne Sandstone, and intruding granites. A strong NW-SE foliation is observed in the region paralleled by numerous quartz veins. The reader is referred to Mujdrica, 1995b for a geological map of the licence area.

Residual soil and aeolian sand predominantly cover the C1 to C5 anomalies. Dominant rock types include quartz-mica schist with andalusite porphyroblasts (Bullion Schist) and amphibolite lenses, which appear conformable with the schist. Numerous quartz veins parallel S1 schistosity and fracture cleavage planes. The quartz veins are chalcedonic, usually highly fractured and locally gossanous.

Sheared quartz-mica schist (Bullion Schist) and locally epidotised amphibolite dominate NW Petricks. The amphibolite appears conformable to the schist unit as it parallels the S1 schistosity. Bullion Schist outcrops prominently in the area intruded by granite and diorite sills. A highly silicified porphyritic rhyolite with abundant quartz stockwork veining (Mt Strzelecki Volcanics) is also present in the area.

5 EL 10013 - WORK COMPLETED

5.1 RECONNAISSANCE

5.1.1 Surface Sampling

A surface sampling program comprising 35 Lag samples and 94 soil samples was completed within the Antelope EL, see [Figure 3](#) for sample locations. Lag sample locations were targeted to follow up previously reported low level As anomalism. Soil sampling targeted areas mapped as Lander Rock Beds, these are considered prospective host units for gold mineralisation.

Samples were sent to Genalysis and analysed using B/EETA (Au), A/MS (Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W) and A/AAS (Co, Cu, Fe, Ni, Zn) as detailed in Table 2 below.

Results were generally low, < 1ppb Au.

TABLE 2: EL 10013 - LAG and Soil Sample Details.

Sample Type	No of Samples	Sample Numbers	Elements Analysed	Genalysis Method
LAG	35	3634933- 3634967	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS
Soil	94	3259596- 3259689	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS

5.1.2

Aircore Drilling

Aircore drilling was undertaken within the Antelope SEL to test previously reported soil anomalism and to provide a better understanding of the regolith and base rock geology within the licence area. Drillhole locations are plotted in [Figure 3](#).

A total of 8 drillholes for 471m and 163 samples were completed, see Table 3 for program details. Drillholes were drilled at a 60° dip and to a maximum depth of 60m. Samples were sent to ALS for analysis using Au-GF42 and ME-ICP43, see Table 4 for details.

Overall results were generally <1ppb Au.

TABLE 3: EL 10013 - Drillhole Collar Details.

Drillhole Type	Drillhole ID	No. Holes	Metres	Dip
Aircore	ANTAC0001- ANTAC0008	8	471	-60°

TABLE 4: EL 10013 - Drillhole Sample Details.

Sample Type	Sample ID	No. Samples	Elements Analysed	Genalysis Method

6 SEL 10038 - WORK COMPLETED

6.1 RECONNAISSANCE

6.1.1 Surface Sampling

A surface sampling program comprising 11 Lag samples and 53 soil samples was completed within the Thumper SEL, see [Figure 3](#) for sample locations. Lag sample locations were targeted to follow up previously reported low level As anomalism. Soil sampling targeted areas mapped as Lander Rock Beds, these are considered prospective host units for gold mineralisation.

Samples were sent to Genalysis and analysed using B/EETA (Au), A/MS (Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W) and A/AAS (Co, Cu, Fe, Ni, Zn) as detailed in Table 5 below.

Results were generally low, < 1ppb Au.

TABLE 5: SEL 10038 - LAG and Soil Sample Details.

Sample Type	No of Samples	Sample Numbers	Elements Analysed	Genalysis Method
LAG	11	3634909- 3634917 3634931- 3634932	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS
Soil	53	3259501- 3259524 3259559- 3259587	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS

6.1.2

Aircore Drilling

Aircore drilling was undertaken within the Thumper SEL to test previously reported soil anomalism and to provide a better understanding of the regolith and base rock geology within the licence area. Drillhole locations are plotted in [Figure 3](#).

A total of 33 drillholes for 1902m and 662 samples were completed, see Table 6 for program details. Drillholes were drilled at a 60° dip and to a maximum depth of 60m. Samples were sent to ALS for analysis using Au-GF42 and ME-ICP43, see Table 7 for details.

TABLE 6: SEL 10038 - Drillhole Collar Details.

Drillhole Type	Drillhole ID	No. Holes	Metres	Dip
Aircore	THUAC0001- THUAC0033	33	1902	-60°

TABLE 7: SEL 10038 - Drillhole Sample Details.

Sample Type	Sample ID	No. Samples	Elements Analysed	Genalysis Method
Aircore	3174724- 3175000 3180001- 3180029 3180175- 3180533	662	Au As, Bi, Cu	Au-GF42 ME-ICP43

7 SEL 22042 - WORK COMPLETED

7.1 RECONNAISSANCE

7.1.1 Surface Sampling

A surface sampling program comprising 22 Lag samples and 42 soil samples was completed within the Odysseus SEL, see [Figure 3](#) for sample locations. Lag sample locations were targeted to follow up previously reported low level As anomalism. Soil sampling targeted areas mapped as Lander Rock Beds, these are considered prospective host units for gold mineralisation.

Samples were sent to Genalysis and analysed using B/EETA (Au), A/MS (Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W) and A/AAS (Co, Cu, Fe, Ni, Zn) as detailed in Table 8 below.

Results were generally low, < 1ppb Au.

TABLE 8: SEL 22042 - LAG and Soil Sample Details.

Sample Type	No of Samples	Sample Numbers	Elements Analysed	Genalysis Method
LAG	22	3634900 – 3634908 3634918 – 3634919 3634921 – 3634928 3634930, 3634934, 3634939	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS
Soil	42	3259525 – 3259544 3259546 – 3259549 3259552 – 3259558 3259588 – 3259589 3259595	Au	B/EETA
			Ag, As, Bi, Mo, Pb, Sn, Sb, Th, U, W	A/MS
			Co, Cu, Fe, Ni, Zn	A/AAS

7.1.2

Aircore Drilling

Aircore drilling was undertaken within the Odysseus SEL to test previously reported soil anomalism and to provide a better understanding of the regolith and base rock geology within the licence area. Drillhole locations are plotted in [Figure 3](#).

A total of 7 drillholes for 420m and 145 samples were completed, see Table 9 for program details. Samples were sent to ALS for analysis using Au-GF42 and ME-ICP43, see Table 10 for details.

Overall results were generally <1ppb Au, the best results returned were:

ODYAC0004 – 3m @ 9ppb Au

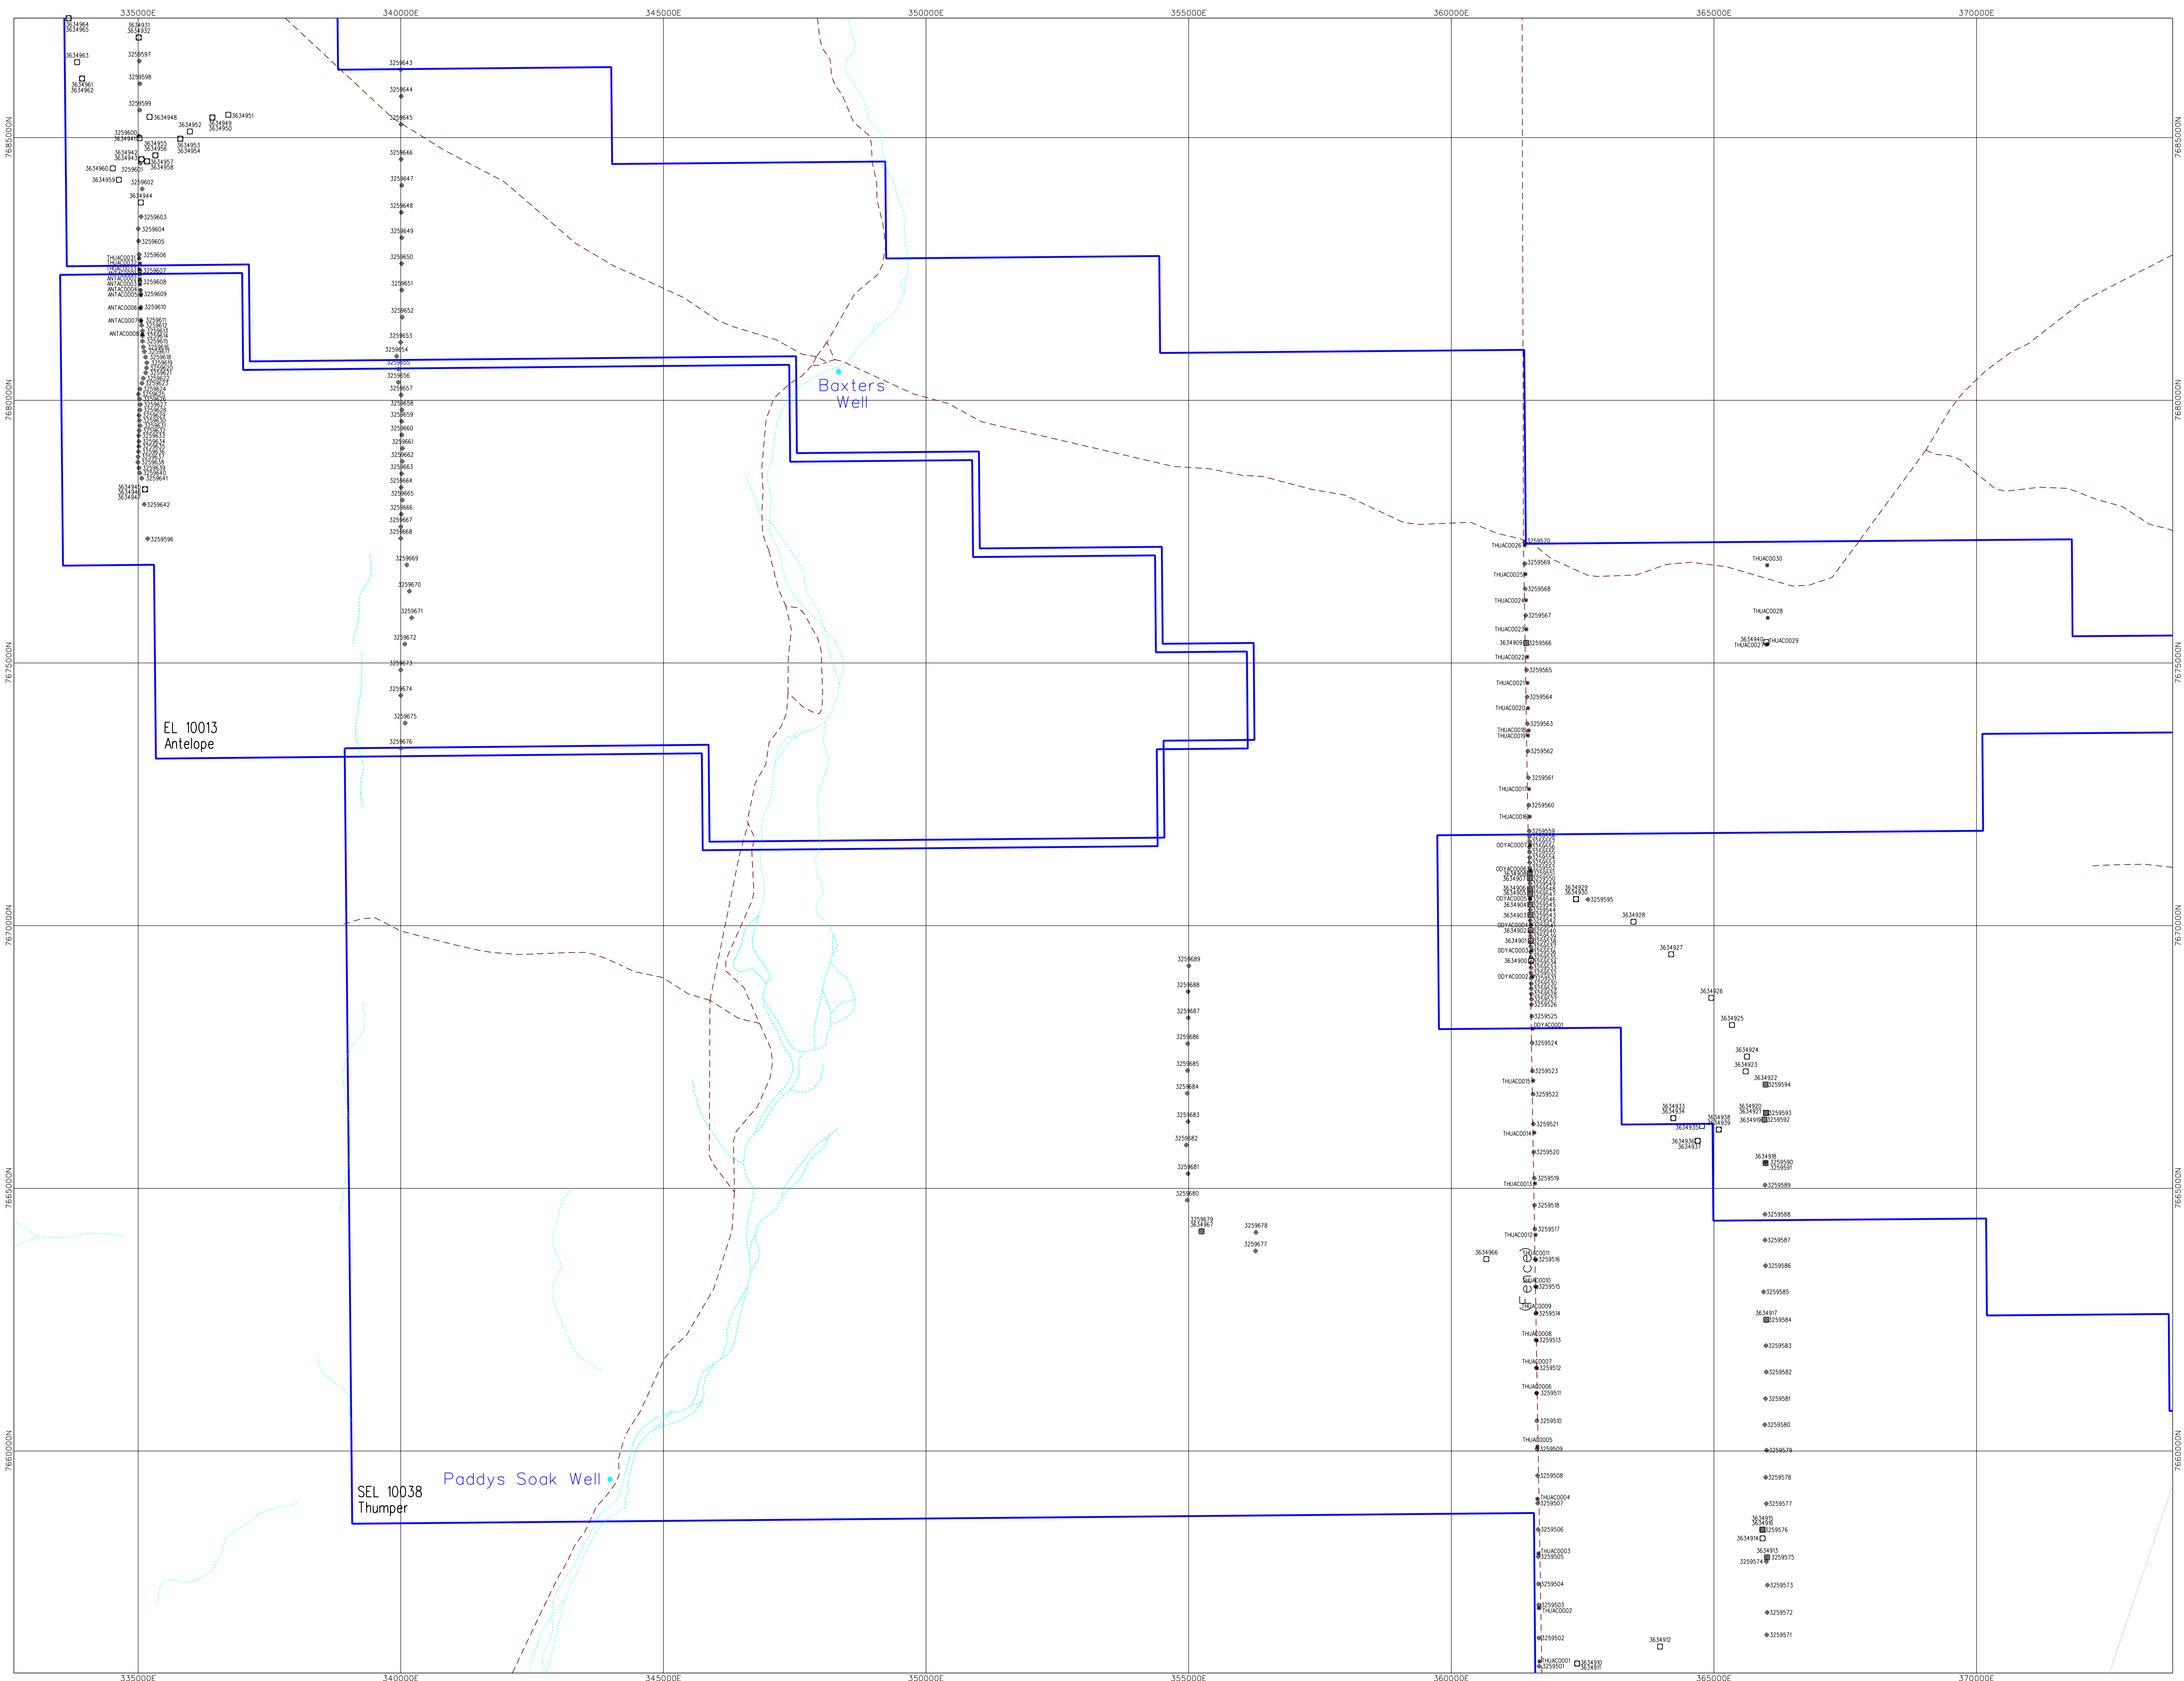

ODYAC0006 – 3m @ 8ppb Au

TABLE 9: SEL 22042 - Drillhole Collar Details.

Drillhole Type	Drillhole ID	No. Holes	Metres	Dip
