REPORT NO: 13503
TITLE: ANNUAL REPORT FOR EXPLORATION LICENCE 8142 FOR THE
PERIOD 23/8/93 to 22/8/94, BARROW CREEK DISTRICT,
NORTHERN TERRITORY, CROWCALL PROSPECT
AUTHOR: J KUONI
DATE: SEPTEMBER 1994

1. SUMMARY

Exploration Licence 8142 is currently being explored for shear hosted and/or "Granites" style gold mineralisation under a joint venture agreement between Poseidon Gold Limited (PosGold), Normandy Exploration (Norex) and Yuendumu Mining Company (YMC). The licence forms part of the Barrow Creek Group of tenements. During year one of tenure an exploration programme involving hand and compass gridding and regional soil geochemistry was undertaken. In addition a low level airborne magnetic and radiometric survey was completed, covering 50% of EL 8142.

2. INTRODUCTION

The area covered by the Barrow Creek Joint Venture (BCJV) is located approximately 200 kilometres south of Tennant Creek. Exploration Licence 8142, situated on the eastern edge of the group of tenements, comprises 15 graticular blocks granted on 23 August 1993.

To date, exploration over the licence area has included hand and compass gridding, a minus 80 mesh soil sampling programme and a low level airborne magnetic and radiometric survey, summarised in Table 1.

TABLE 1
SUMMARY WORK STATISTICS FOR EL 8142
FOR THE PERIOD 23/8/93 TO 22/8/94

GRIDDING -		
Hand and Compass		10.4 km
GEOCHEMISTRY -		
Minus 80# soil samples		220 samples
GEOPHYSICS -		
Aeromagnetic/radiometric survey		50% of area

2.1 Location and Access

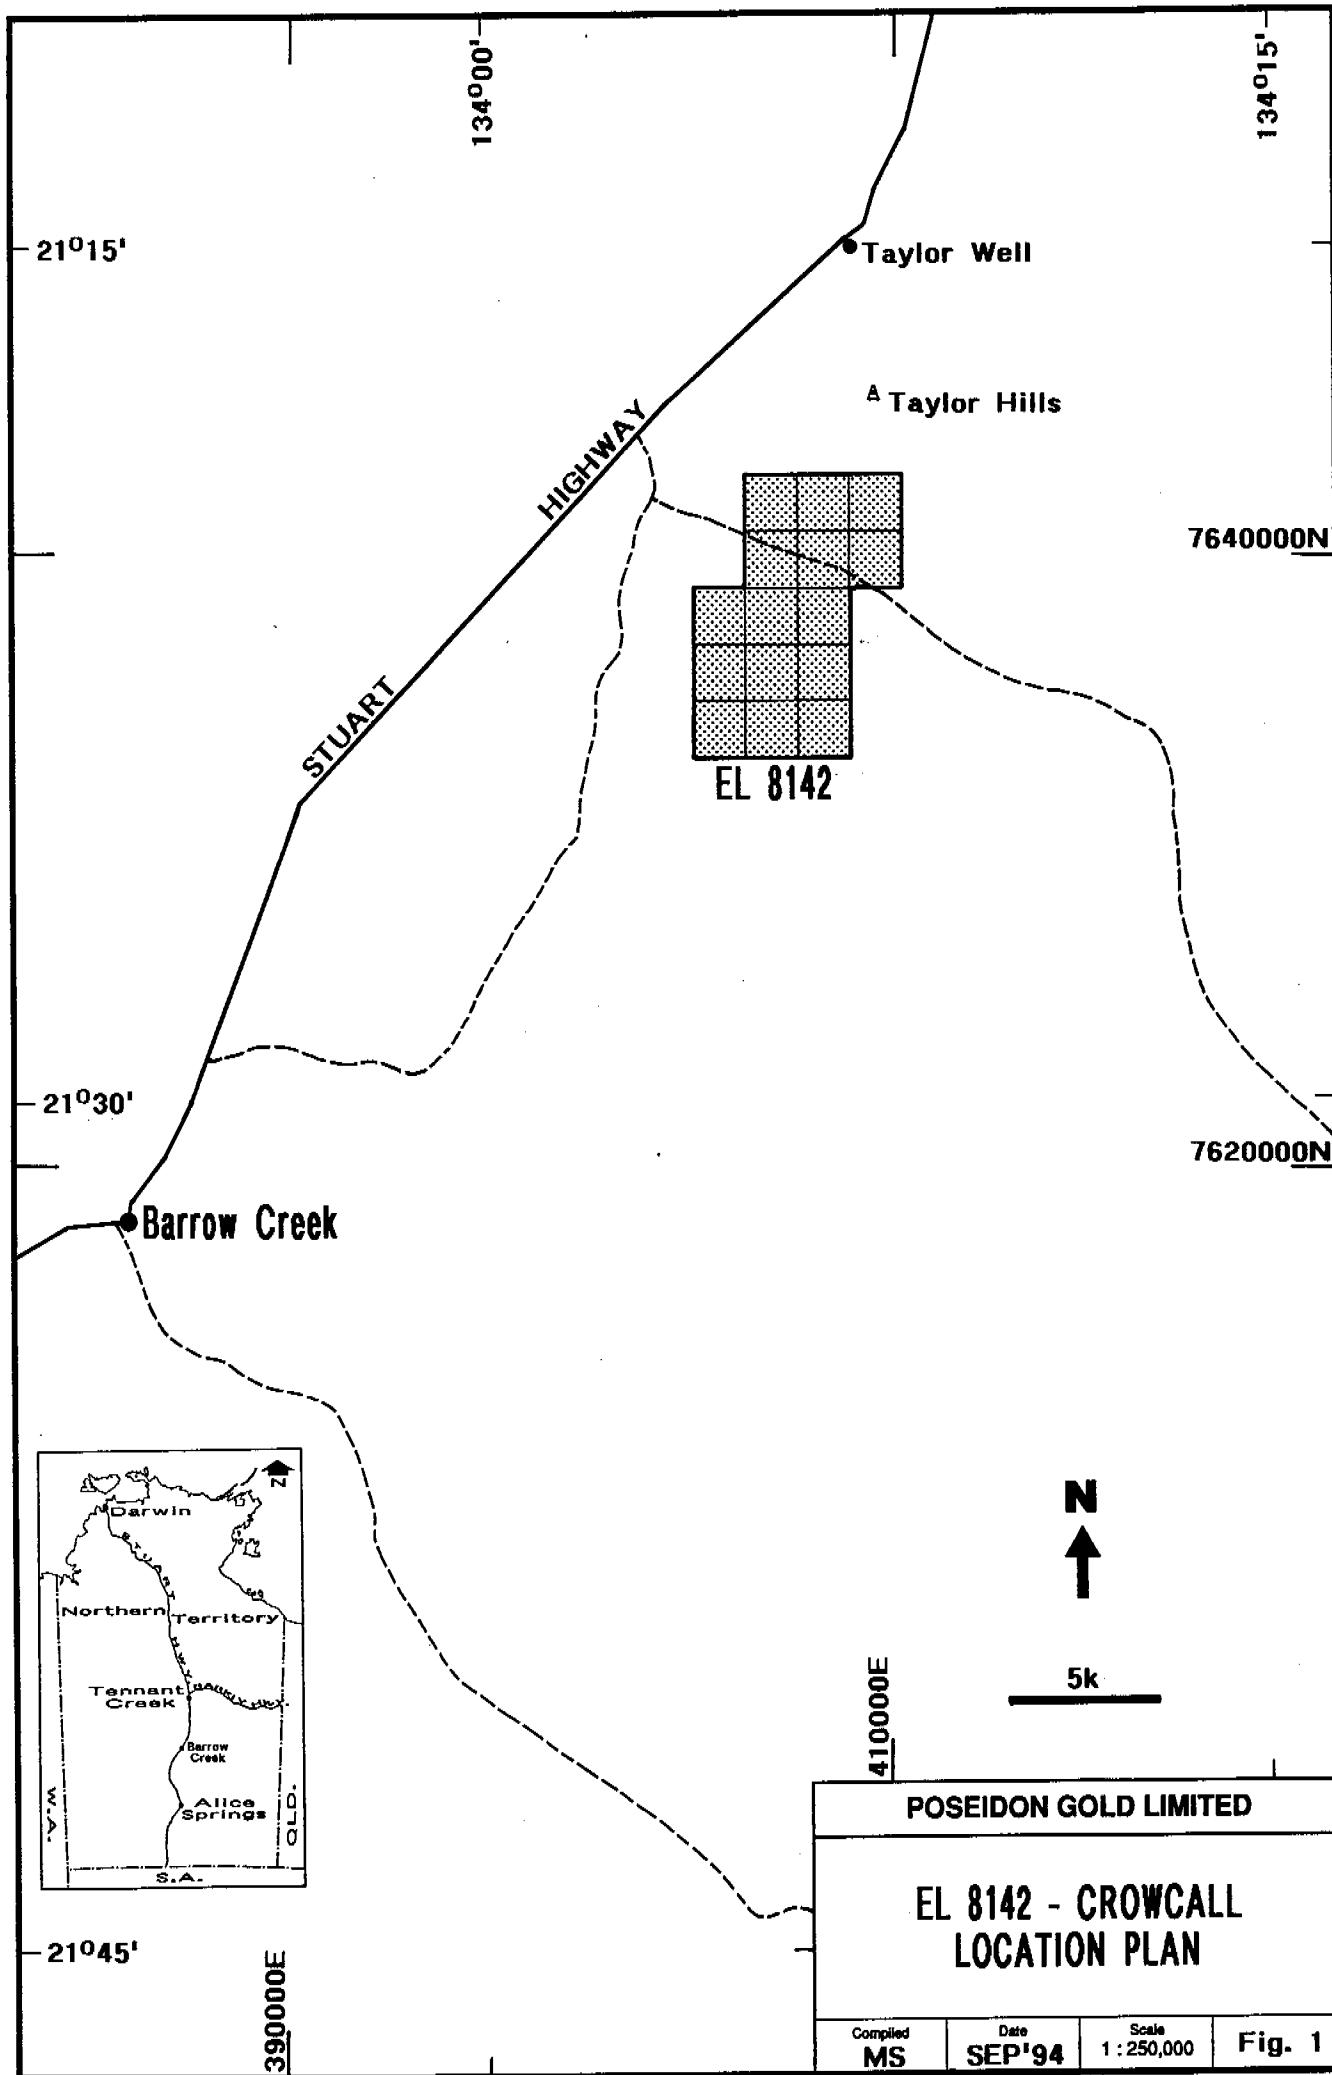

Exploration Licence 8142 is located approximately 35 kilometres north-east of Barrow Creek Hotel, on Neutral Junction Station. Access is via the Stuart Highway and several well maintained station tracks, refer Figure 1.

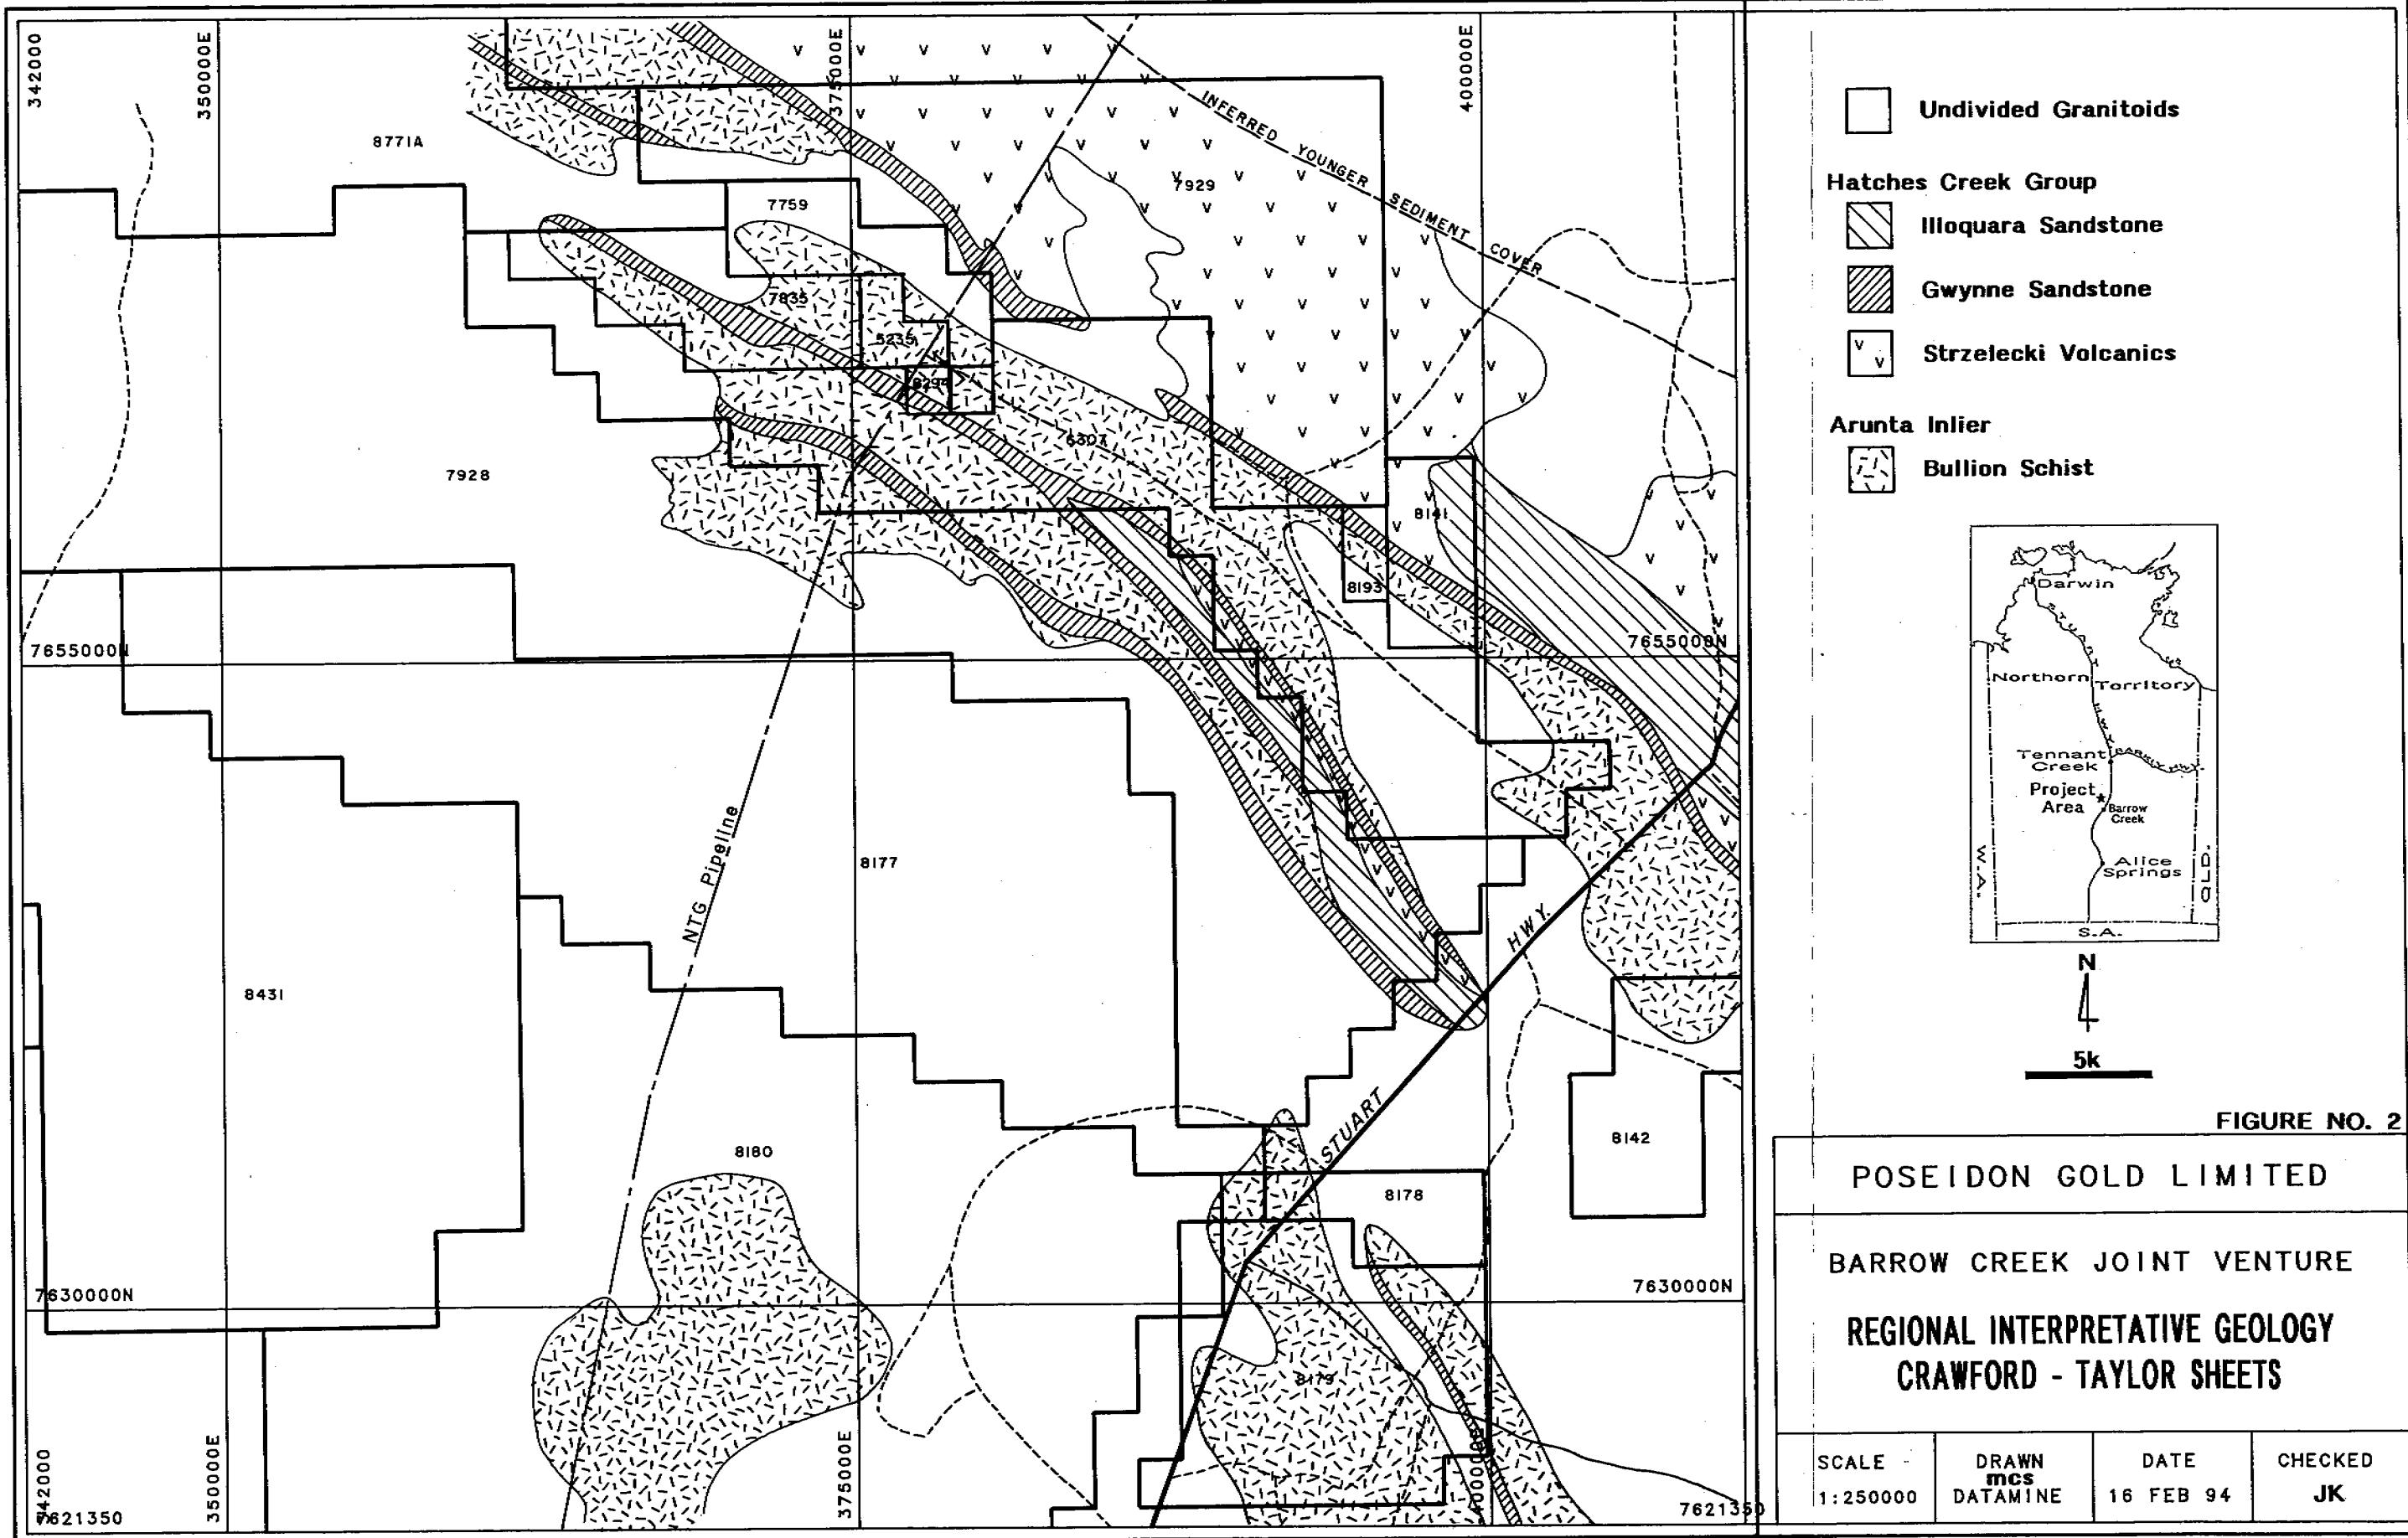

2.2 Tenement Status

The area within exploration licence 8142 was initially granted to Australian Development Limited (ADL), now PosGold, and included under the BCJV area of interest as Exploration Licence 6306. This area was explored and subsequently reduced over the course of its tenure until relinquishment on 15 October 1992. The current 15 blocks were applied for and granted on 23 August 1993, for a period of six years.

2.3 Previous Exploration

The only evidence of exploration within or adjacent to the licence area is by Kewanee Australia Pty Ltd, who undertook a broad exploration programme within the Crawford-Osborne Range area from 1970-74. A combination of aeromagnetics, radiometrics and EM surveys delineated several targets which were followed up with geological mapping and sampling. A reverse circulation/diamond drilling programme defined a sub-economic Cu-Ni resource (Prospect D) within 1km of the northern boundary of EL 8142, refer Figure 2. The resource grade was considered too low and the ground was subsequently relinquished in 1973.

Other exploration in the Barrow Creek region was conducted by Australus Mining Co Pty Ltd during 1969 for base metal potential in the Crawford Range area. Pegmatites, granites and metadolerites were targeted with disappointing results.

3. GEOLOGICAL SETTING

3.1 Regional Geology

Biotite/muscovite-quartz schists of the Bullion Schist Formation are the oldest rocks identified in the Barrow Creek area. Accompanied by discontinuous lenses of amphibolite/metadolerite, these comprise the Arunta Inlier. Deformation and regional metamorphism to upper greenschist facies took place between 1810-1750 Ma (Black, 1981).

Unconformably overlying these rocks are the Lower Proterozoic Hatches Creek Group, comprising shallow marine sediments and felsic to mafic volcanics. The Hatches Creek Group can be subdivided into a lower and upper unit, the first made up of immature sandstones and pelites, while the upper unit comprises more mature cross-bedded arenites and siltstones.

Following deposition, the Hatches Creek Group was folded about NW trending axes and metamorphosed to upper greenschist facies. Later intrusion of both the Arunta basement and the Hatches Creek Group by granitoids took place around 1660 Ma (Blake et al, 1987).

A long erosional period followed with subsequent weathering during the Tertiary to produce silcrete and ferricrete horizons. A thin veneer of quaternary sands and soils overlays the area.

3.2 Local Geology

Surface geology over Exploration Licence 8142 ranges from massive outcrop to relatively thick cover. Mica-quartz schists to moderately metamorphosed sediments are the dominant lithotype, with a series of mafic rocks including metadolerites to metadacites running north-south through the central portion of the area. Massive granite intrudes the sediments to the west.

4. EXPLORATION SUMMARY AND RESULTS FOR THE PERIOD 23/8/93 TO 22/8/94

EL 8142 has undergone an exploration programme involving hand and compass gridding, follow-up regional soil geochemistry and an aeromagnetic survey over the northern portion.

4.1 Minus 80 Mesh Soil Geochemistry

During the tenure of exploration licence 6306 a regional soil sampling programme was carried out on a 500 metre x 250 metre spaced grid covering interpreted Bullion Schist formation. A subtle gold response of 12 ppb with minor arsenic responses were returned. No further work was carried out on this area under EL 6306. In 1993 a reappraisal of all regional soil geochemical data for the Barrow Creek region led to the application for EL 8142 to further investigate the 12 ppb Au value. Subsequently a follow-up programme was carried out during 1993, with 220 infill soil samples being collected on 50 metre x 200 metre spacings. This work defined several low order gold anomalies, including a 0.6 x 0.1km anomaly with a peak gold value of 13 ppb Au. Arsenic values peaked at 12 ppm, with an average of 3-4 ppm.

Plans 1-3 show the follow-up soil locations and assay values, with relevant original soil geochemical data. Geochemical assay data is presented in Appendix 1.

4.2 Aeromagnetic Survey

An airborne magnetic and radiometric survey along 100 metre spaced lines at 40 metres mean terrain clearance was completed during April 1994 by World Geoscience Corporation Ltd (Aerodata). A total of 11,200 line kilometres were flown in a NW-SE strip, incorporating the northern section of EL 8142.

Preliminary results have been received and this has highlighted detailed structural features within the area of interest. Final results are expected over the next few months, and a detailed interpretative geological map will be produced from all the data, and reported in the next Annual report for EL 8142.

5. EXPLORATION EXPENDITURE FOR THE PERIOD 23/8/93 TO 22/8/94

Expenditure on Exploration Licence 8142 for the first year of tenure is outlined in Table 2 below:

TABLE 2
EXPLORATION EXPENDITURE FOR EL 8142
FROM 23/8/93 TO 22/8/94

EXPENSE	COST
Employee Costs	\$ 2,963
Overheads	\$ 151

Assays	\$ 2,000
Operating Costs	\$ 2,595
Specialist Services	\$ 10,755
Tenement Costs	\$ 115
	<hr/>
TOTAL	\$ 18,579
	<hr/>
Covenant	\$ 14,000

**6. PROPOSED EXPLORATION AND EXPENDITURE FOR THE PERIOD
23/8/94 TO 22/8/95**

Exploration over EL 8142 during the next 12 month period will include continued regional soil geochemistry over untested areas of interpreted Bullion Schist. Sampling will mainly concentrate on the southern portion of the licence, covering areas identified through BMR aeromagnetic data. A bedrock vacuum drilling programme is proposed to follow-up the anomalous soil geochemistry defined to date, as well as any further anomalies which may be defined during the next phase of soil sampling.

Geological interpretation of the recently flown aeromagnetic survey will be undertaken to provide structural and lithological information at regional and prospect scales to direct exploration in the area.

A summary of proposed exploration expenditure is given in Table 3 below:

TABLE 3
PROPOSED EXPENDITURE ON EL 8142
FOR THE PERIOD 23/8/94 TO 22/8/95

EXPENSE	COST
Employee Costs	\$ 5,700
Overheads	\$ 2,500
Drilling	\$ 2,250
Assays	\$ 4,050
Operating	\$ 3,000
Specialist Services	\$ 2,000
Research	\$ 500
	<hr/>
	\$ 20,000
	<hr/>
