ABSTRACT

During the 1988 field season Ashton Mining Limited as Manager of the A.D.E. Joint Venture explored an area in the Mount Drummond-Calvert Hills-Brunette Downs region of which Exploration Licence 4360 forms a part.

The exploration program aimed at the location of kimberlite pipes, was concentrated to the south and west of Exploration Licence 4360, in E.L's 4352 and 4359, thought to represent the most prospective acreage.

Work carried out in the immediate confines of E.L. 4360 included detailed logging of both follow-up diamond and RAB holes drilled (as part of last year's program) over magnetic anomaly 'C8/9' and geological mapping within the southern portion of the licence area.

It is anticipated that an assessment of all drilling and sampling results in conjunction with detailed geological interpretation of the Coanjula region may lead to additional RAB or follow-up diamond drilling within Exploration Licence 4360.

1.00 INTRODUCTION

Exploration Licence 4360 covers an area of 1,610 square kilometres (500 blocks) on the Calvert Hills 1:250,000 sheet (refer to Figure 1).

The licence, which was granted to Plenty River Mining Company (N.T.) Limited on 13th September, 1983, is subject to an option agreement with the A.D.E. Joint Venture comprising, Ashton Mining Limited, Aberfoyle Exploration Pty. Limited, Australian Diamond Exploration N.L. and Fibade Pty. Limited. The title was later transferred to Ashton Mining Limited, the transfer being approved by the Department of Mines and Energy on 9th April, 1984.

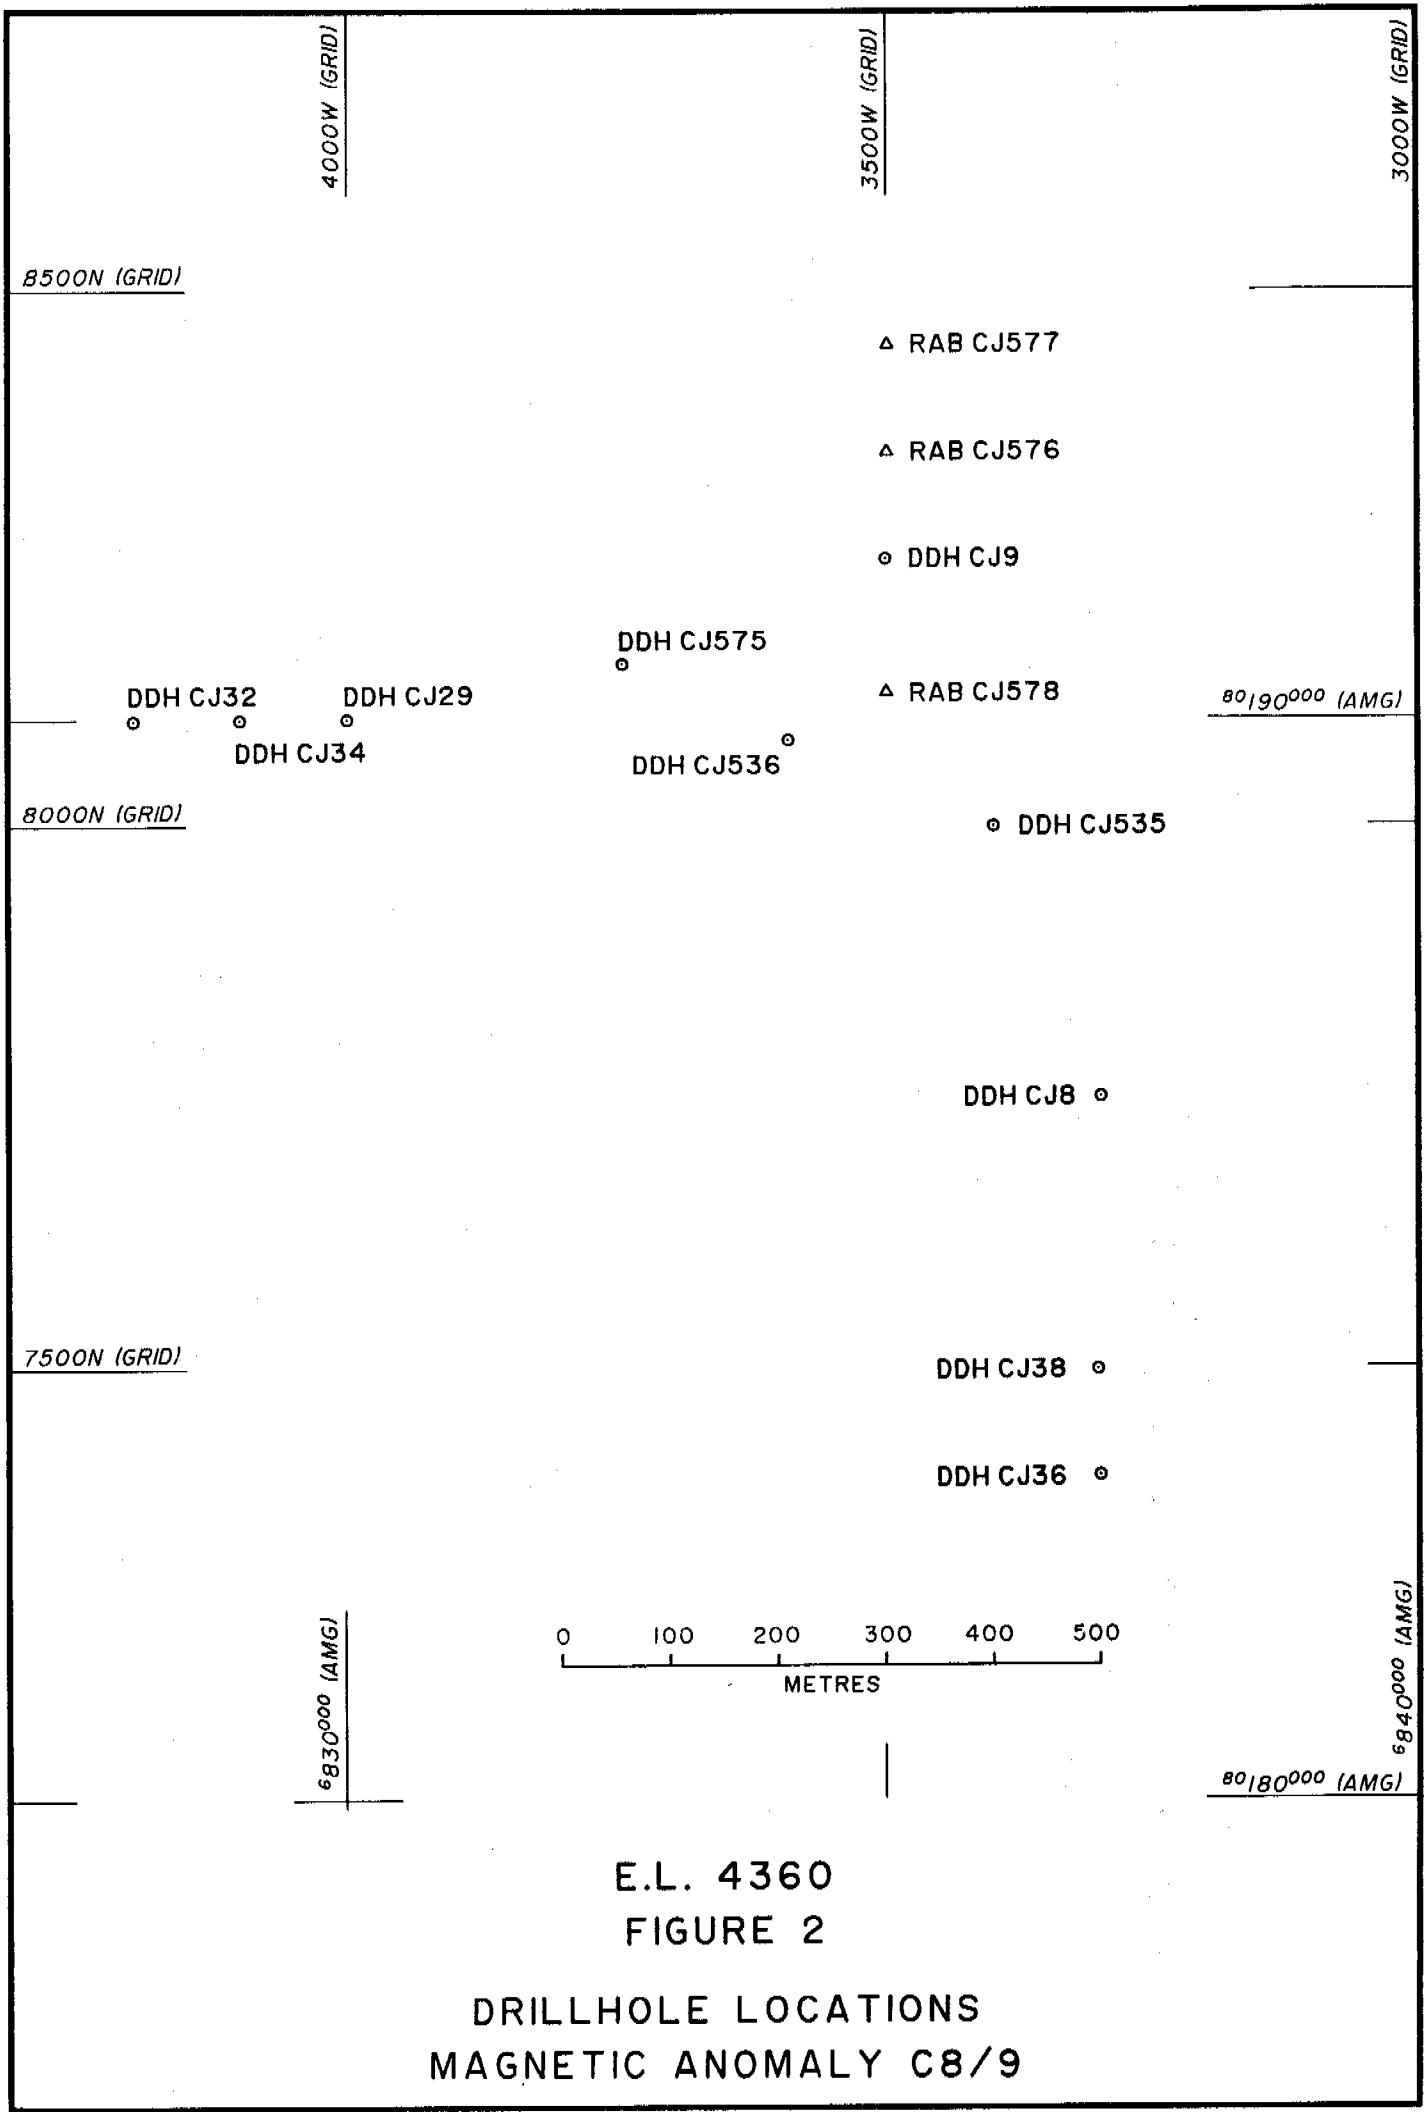

During the fifth year of tenure of the licence work within E.L. 4360 comprised re-examination and detailed logging of both follow-up diamond and RAB holes drilled (as part of last year's exploration program) over magnetic anomaly 'C8/9'.

Detailed geological mapping within the southern portion of the licence area was undertaken as part of a larger program incorporating Exploration Licences 4342, 4352 and 4359. The work was carried out in an attempt to aid in the evaluation of all previous drilling and sampling results within the Coanjula region.

2.

This report gives a summary of the work completed within
E.L. 4360 during the period 13th September, 1987 to 12th
September, 1988

A statement of expenditure covering this period is included
in the report.

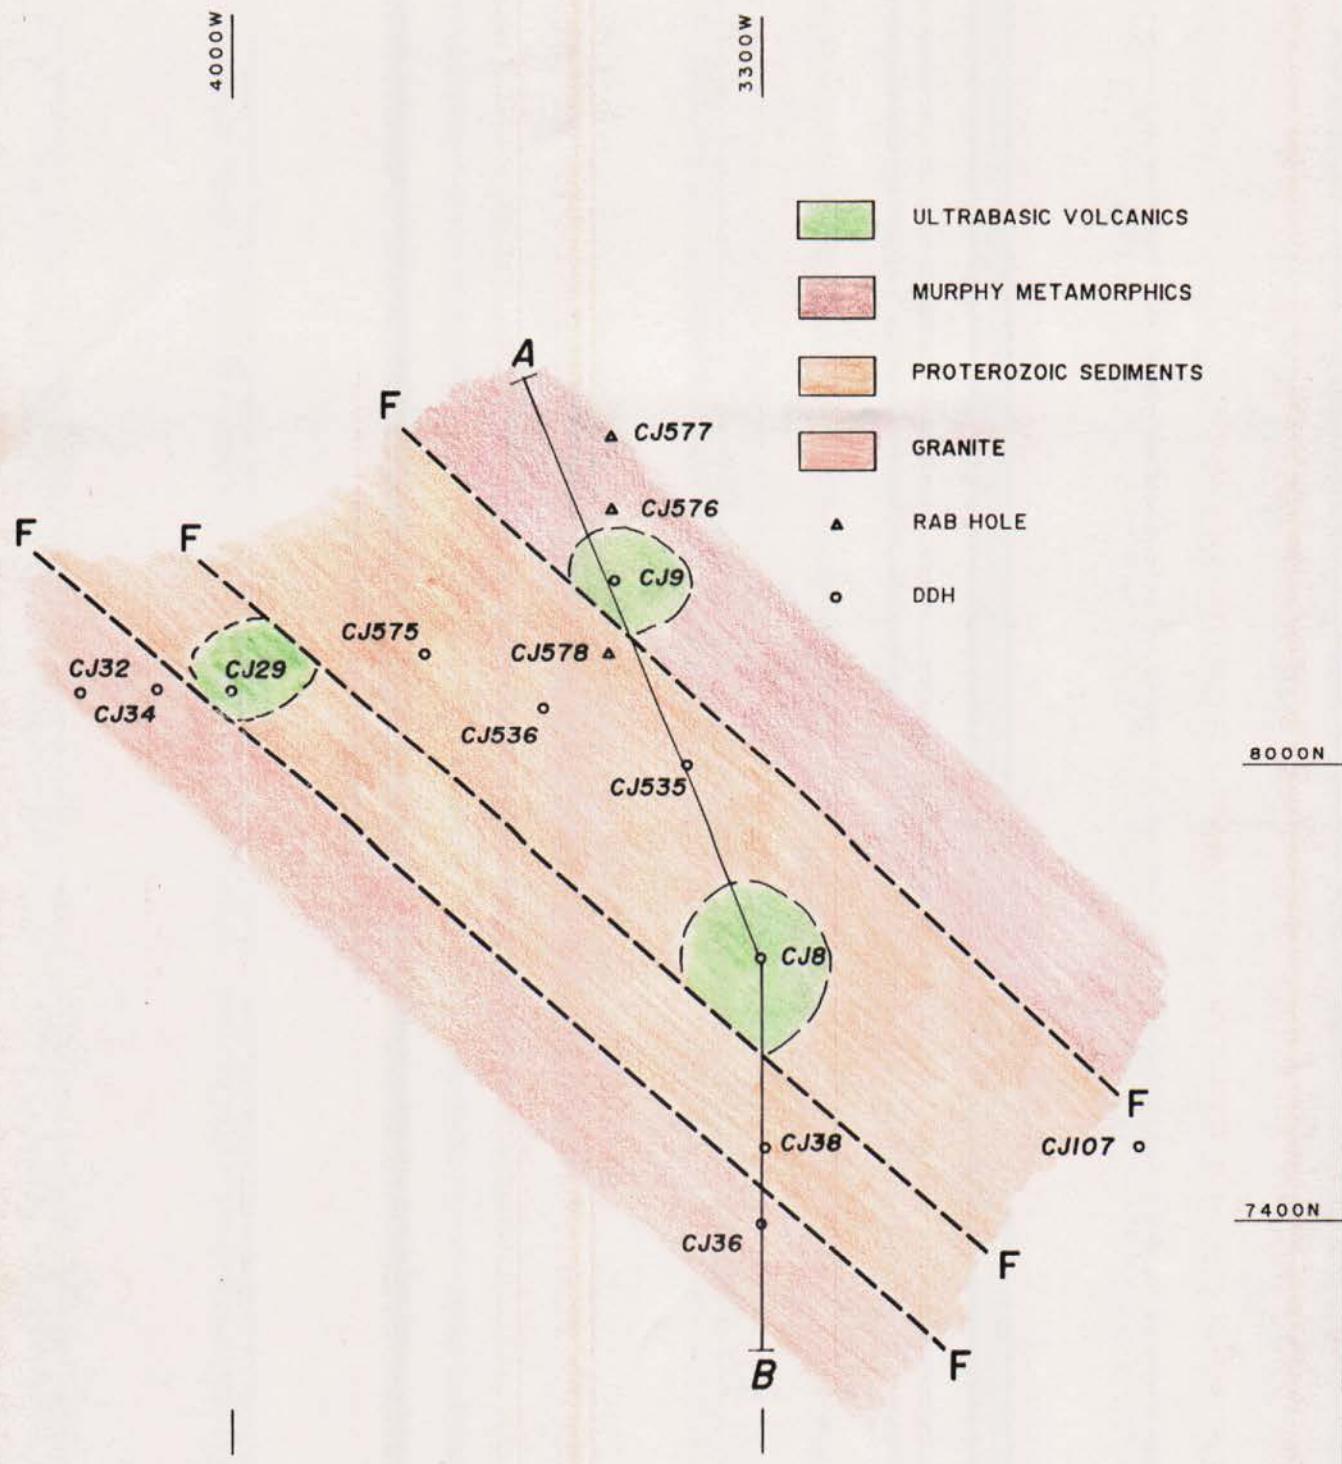

2.00 WORK COMPLETED

Magnetic anomaly 'C8/9' was initially identified through an airborne magnetic survey flown on behalf of the A.D.E. Joint Venture by Geometrics International Incorporation over the entire licence area of E.L. 4360. The magnetic target was subject to follow-up investigations involving a detailed ground magnetic survey and diamond drilling during the 1984/1985 and 1985/1986 field seasons (results of which were presented in previous annual reports for E.L. 4360). Refer to Plan 1 for anomaly and drillhole locations.

As part of last year's exploration activities additional follow-up diamond drilling in conjunction with RAB drilling were completed over anomaly 'C8/9' in an attempt to define structural and stratigraphic relationships associated with the igneous rocks encountered at this locality. The follow-up drilling program (comprising a total of 486 metres) was completed just prior to the close of the fourth year of tenure of the licence and at the time of writing of last year's annual report for Exploration Licence 4360 detailed logging of the diamond and RAB holes remained to be undertaken. This work was completed at the commencement of the licence's fifth term, results of which are herein presented.

Summarized drill logs for RAB holes (CJ576-CJ578 inclusive) and diamond drillholes (CJ535, CJ536 and CJ575) incorporating core recovery and lithological interpretation are given in Appendix 1. The location of the relevant

FIGURE 4

follow-up holes in relation to previous diamond drilling completed over anomaly 'C8/9' is shown in Figure 2.

The main lithologies encountered during the RAB/diamond drilling program included metasediments of the Murphy Metamorphics and Proterozoic sediments comprising sandstones, siltstones and quartzites. Granite basement was intersected in one of the diamond drillholes (CJ575) and at a depth of 115 metres.

No igneous rocks were identified through detailed logging of the drill core and spoil chips and it would appear that three discrete ultrabasic intrusive bodies are present centred on diamond drillholes CJ8, CJ9 and CJ29.

A plan-view (Figure 3) and corresponding cross-section (Figure 4) representing geological interpretation of all drilling results associated with magnetic anomaly 'C8/9' are presented opposite.

Additional work completed within E.L. 4360 during the 1988 field season involved detailed geological mapping concentrated within the southern portion of the licence area. This work was undertaken as part of a larger program to include Exploration Licences 4342, 4352 and 4359 within the Coanjula region.

3.00 FUTURE PROGRAMS

Exploration Licence 4360 forms part of a larger area in which the A.D.E. Joint Venture carried out an exploration program aimed at the location of kimberlite pipes.

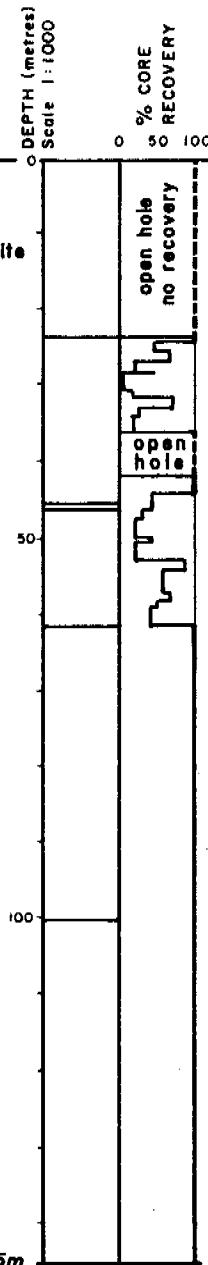

Data generated by the 1988 field season's exploration activities within the Coanjula region, which included both RAB and diamond drilling and sampling and detailed geological mapping, is currently being assessed in conjunction with all previous results. It is anticipated that the assessment may determine the need for additional RAB or follow-up diamond drilling within Exploration Licence 4360.

APPENDIX 1

Drillhole : CJ535

Magnetic anomaly : C8/9

Grid position : 3400W , 8000N

Open hole ; overburden, Proterozoic mudstone, siltstone and quartzite

Proterozoic
banded chert breccia and quartzite

Brecciated oolitic chert marker bed

Proterozoic
banded chert breccia and quartzite

Proterozoic
dolomitic siltstones and shales, brecciated in places

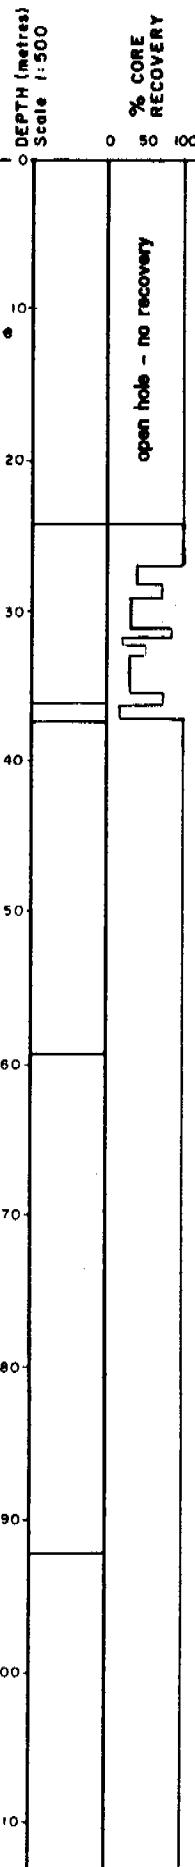

Metasediments
grey, massive, siltstone and greywacke

'Overburden' : includes black soil, unconsolidated to semiconsolidated Cretaceous(?) and other sediments.

Drillhole : DDHCJ536

Magnetic anomaly : C8/9

Grid position : 3600W , 8100N

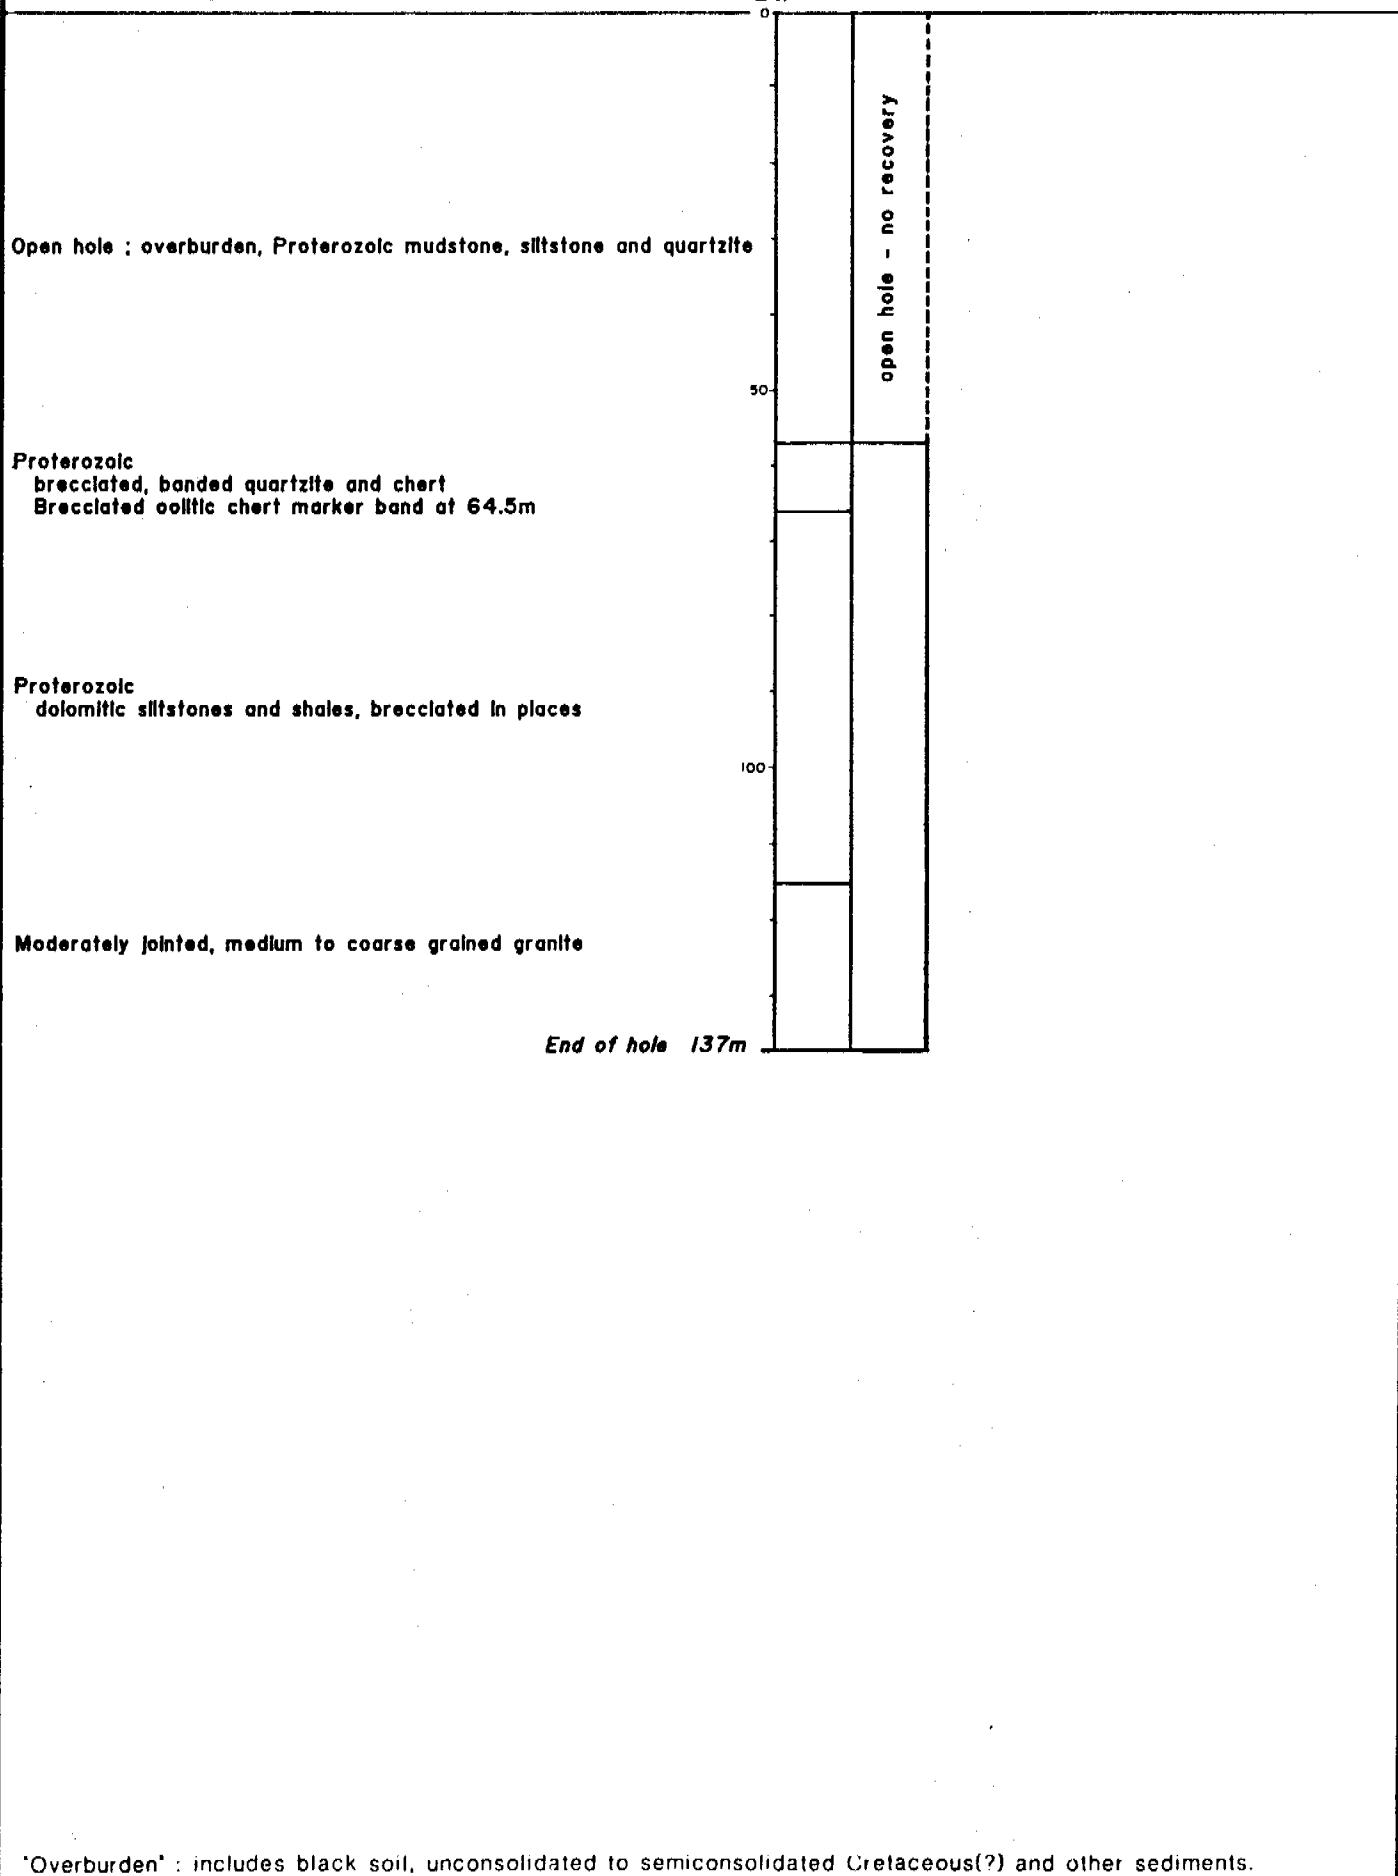

*Overburden : Includes black soil, unconsolidated to semiconsolidated Cretaceous(?) and other sediments.

Drillhole : CJ575

Magnetic anomaly : C8/9

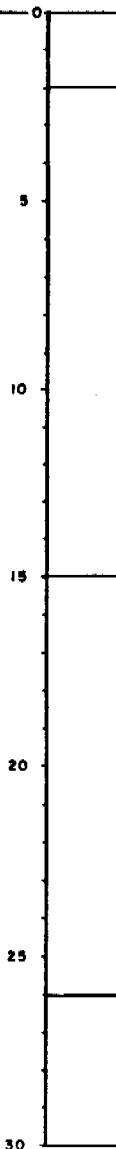

Grid position : 3750W , 8150N

Drillhole : RABCJ576
Magnetic anomaly : C8/9
Grid position : 3500W , 8350N

DEPTH (metres)
Scale 1:200

Black soil

Pale yellow to pale green silt and calcrete

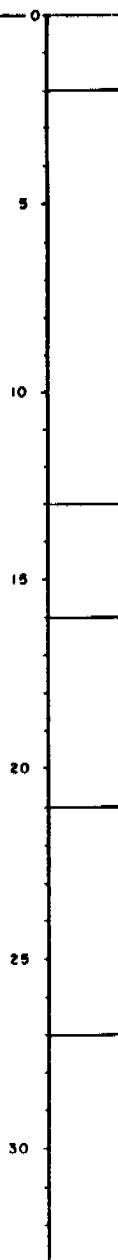

Grey mudstone, minor sand

Very fine friable sand

Drillhole : RABCJ577
Magnetic anomaly : C8/9
Grid position : 3500W , 8450N

DEPTH (metres)
Scale 1:200

Black soil

Pale yellow to pale green calcrete and silt

Brown mudstone

Grey mudstone

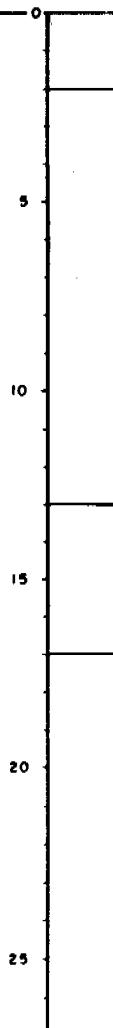

White, very fine grained, friable sand

Orange-brown, micaceous metasediments
(Proterozoic)

Drillhole : RABCJ578
Magnetic anomaly : C8/9
Grid position : 3500W , 8150N

DEPTH (metres)
Scale 1:200
