SUMMARY

A programme of RC drilling on the Forscutt mineral licenses MLN's 497, 867, 896, 900, 914 915 and 917 was completed in early October 1994. The emphasis of the program was targeting extensions of the mineralisation in the main reef north and south of the Henry and Walker open pit, and mineralisation in the eastern reef outlined by previous work.

Drilling on three lines north and south of the open pit at Golden Dyke testing the continuation of the "main" reef lode at shallower depths, has returned anomalous, but below economic grade, Au mineralisation with 1.0 metre @ 0.81 g/t Au from 26.0 metres in FD10.

Results from drilling the eastern reef returned anomalous Au, but well below economic grade, with the exception of one narrow high-grade intersection in drill hole FD7 with 1.0 metre @ 12.6 g/t Au from 46 metres.

Holes targeting hanging wall mineralisation along metasedimentary-dolerite contacts proved to be marginally successful, but below economic grade with intersections in FD3 with 1.0 metre @ 1.62 g/t Au from 33 metres and in FD4 with 3.0 metres @ 0.67 g/t Au from 28-30 metres.

From the results returned in the 1994 program and previous exploration on the Forscutt mineral licenses, no further exploration is recommended to target shallow extensions of mineralisation along the main reef or the eastern reef.

The possibility of a continuation of ore-grade mineralisation still exists down-pitch south of the open pit, and would require a relatively deep diamond hole. However, at the present gold prices access to mineralisation at depth would be uneconomic, and it is therefore recommended that no further exploration be carried out targeting the "main reef" unless the gold price increases significantly.

Recent scout RC drilling at the Davies N*1 prospect MCN 4267, directly north of MLN 914, has identified a narrow, high grade zone of gold mineralisation hosted by carbonaceous shales. This sequence of carbonaceous shales passes south from MCN 4267, across the central and eastern side of MLN 914, and will be the focus of further mapping, soil and rock chip sampling, leading to scout RC drilling in the 1995 field season.

1 INTRODUCTION

1.1 Title

The Forscutt claims at Golden Dyke were granted between the 21/04/80 and 30/07/81 and expire between the 31/12/2000 and 31/12/2001. The mineral licences cover 28.94 hectares and surround MLN 798, which contains the Golden Dyke open pit mine. Northern Gold NL and Reynolds NT entered into a farm-in option agreement with the holders in 1994 with NGNL acting as the manager.

1.2 Location and access

Golden Dyke is situated 145 kilometres southeast of Darwin, a distance of 190 kilometres by road (Figure 1). There is all weather access with the Stuart Highway passing within three kilometres of the property. Access from the Stuart Highway is by the well maintained Sandy Creek road.

1.3 Previous Exploration

Previous detailed exploration was conducted on the Forscutt mineral licenses by Oceania Exploration Mining NL (Orridge April 1987 and Orridge September 1988). Exploration concentrated on testing for ore-grade extensions of the main reef north and south of the existing Henry and Walker Golden Dyke open pit. An initial phase of geological mapping, soil sampling, magnetic surveys and diamond drilling covering the trends of mineralised BIF horizons (Orridge April 1987) was followed up with detailed rock chipping, following the trend of the eastern reef (Orridge September 1988).

Of the five diamond drill holes designed to intersect the main reef, 90 metres north and 80 and 160 metres south of the open pit, only marginal results were returned with the exception of KD-1 with 1.0 metre @ 7.7 g/t Au from 37m.

The soil sampling gave encouraging values up to 1169 ppb and commonly above 100 ppb within MLN's 900, 914 and 915 over the eastern reef, approximately 60 metres east of the main reef. These results suggested the possibility of another lode paralleling the main reef,

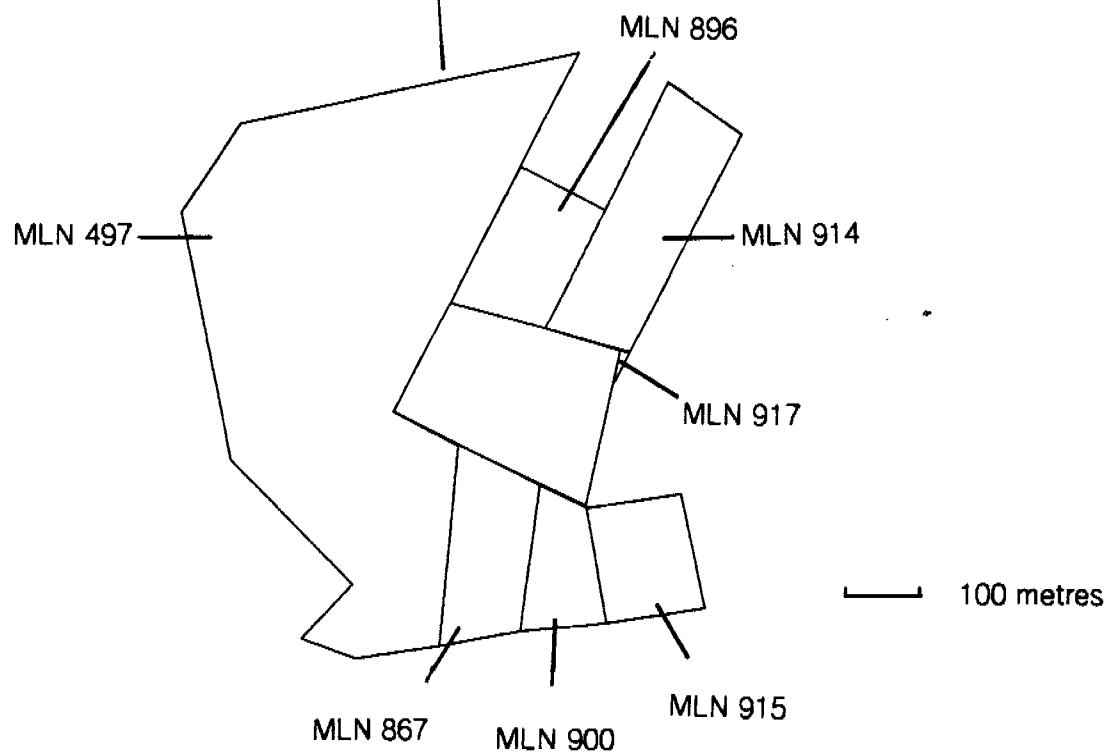

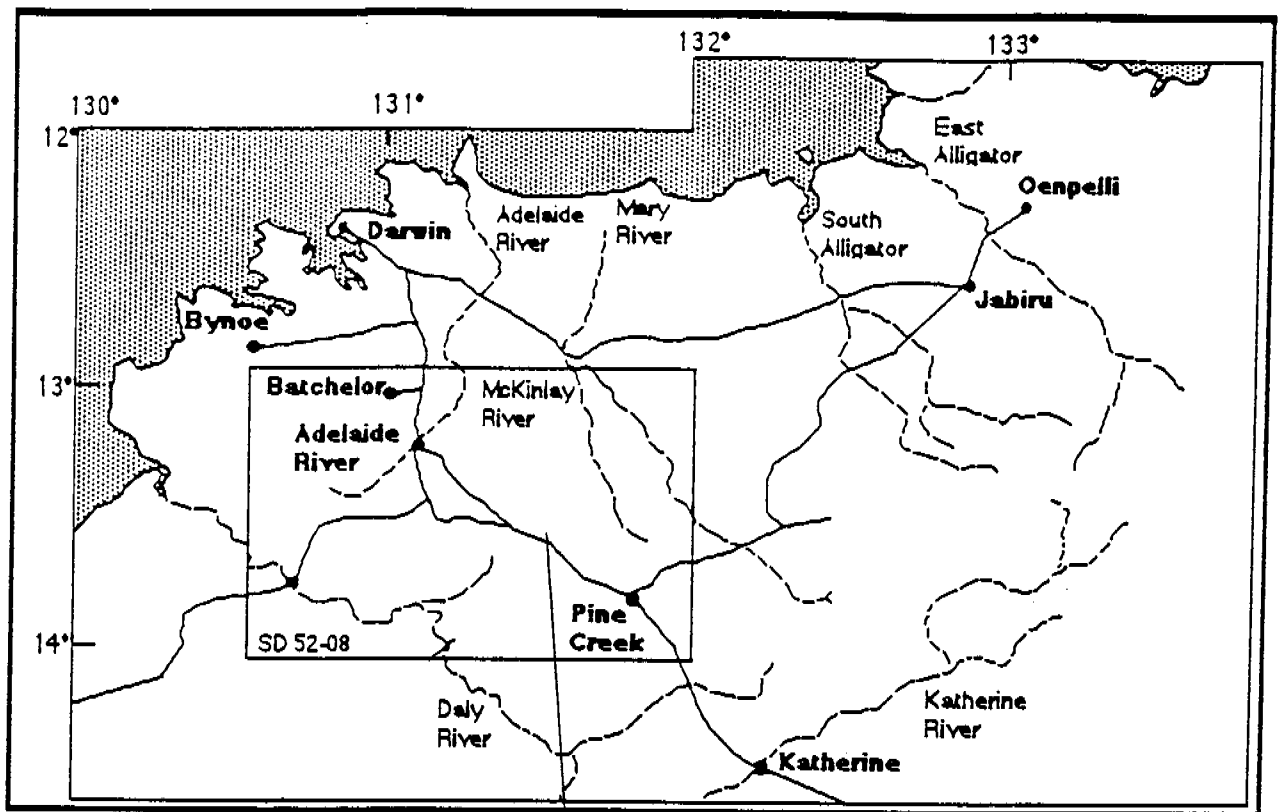

Figure 1

and was the basis for a follow-up rock chip program. In the following rock chip program, samples taken along the line of the Eastern reef gave results between 0.10 and 3.10 ppm Au, confirming the presence of another parallel zone of mineralisation east of the main reef.

2 GEOLOGY

2.1 Regional Geology

MCN's 497-917 are situated within the Pine Creek Geosyncline, a tight to isoclinally folded sequence of mainly pelitic and psammitic Lower Proterozoic with interlayered tuff units. All rocks in the area have been metamorphosed to low, and in places medium grade, metamorphic assemblages. For the purposes of this report the prefix "meta" is implied, but omitted from the rock names and descriptions.

The sequence has been intruded by pre-orogenic sills of the Zamu Dolerite and a number of late syn-orogenic to post-orogenic Proterozoic granitoids. Largely undeformed Middle and Late Proterozoic, Palaeozoic and Mesozoic strata as well as Cenozoic sediments and laterite overlie the Pine Creek Geosyncline rocks.

2.2 Local Geology

The Golden Dyke deposit, occurs at approximately the same stratigraphic horizon around the western margin of the Golden Dyke dome as a number of other mines and prospects (Orridge April 1987). The dominant rock-types hosting the gold mineralisation consist of relatively thin units of banded iron formation, interbedded with pelites and arsenites of the Koolpin Formation, the middle member of the South Alligator Group. The banded iron formations consist of finely laminated assemblages of chlorite, actinolite, garnet, pyrite and haematite, interlayered with nodular bands of granular quartz representing recrystallised chert (Orridge April 1987). The best gold values are associated with relatively high concentrations of pyrite and arsenopyrite (Orridge April 1987).

In the area of the Golden Dyke Mine, economic gold deposits appear to be confined to a single BIF horizon, known as the "main reef" (Orridge April 1987). This formation is about 30 metres thick, with ore confined to the top few metres of the footwall contact with an overlying sill of Zamu dolerite. Three other BIF horizons occur below the main reef through a stratigraphic thickness of 140 metres. The "buck reef" lies about 45 metres below the top of the main reef.

The "eastern reef" and "far eastern reef" lie respectively 25 metres and 80 metres into the footwall from the buck reef. They are poorly outcropping and relatively unsilicious formations (Orridge April 1987).

Another horizon, the "western reef", occurs about 80 metres above the main reef. It consists of banded pyrite/pyrrhotite interbedded with carbonaceous shale and is commonly anomalous in arsenic and is locally anomalous in gold and lead/zinc (Orridge April 1987).

3 EXPLORATION COMPLETED

A RC drill program managed by Northern Gold on the Forscutt mineral licenses, MLN's 497,867, 896, 900, 914, 915 and 917, was completed in early October 1994. On the basis of previous detailed work by Oceania Exploration and Mining NL, a RC drilling program was designed by Northern Gold NL to; firstly, determine conclusively whether, or not, extensions of ore-grade mineralisation along the main reef north and south of the open pit exist; secondly, to determine the extent of sub-surface mineralisation along the eastern reef; and to thirdly, target potential hanging wall gold mineralisation in the metasedimentary rocks above dolerite sill contacts.

3.1 RC Drilling on Forscutts Mineral Licences

Thompson Drilling was contracted to conduct scout RC drilling at Forscutts Dyke. The contractors supplied a Longyear JK8-50 Track-Mounted drill rig with a mobile Atlas Copco 400psi *1000cfm compressor, driller, two assistants and support vehicles to complete the program. All RC drilling utilised a 5 1/2 inch face sampling hammer. A Northern Gold geologist was on site at all times to manage the program. Site preparation involved clearing of four lines with minimal disturbance to surrounding trees and landscape. All samples were split through a 16:1 riffle splitter mounted on the drill rig with the small sample collected in a calico bag for analysis and the remainder collected in a plastic bag for retention on site.

3.2 Drilling Results from Forscutts Mineral Licences

A total of 18 drill holes were completed for 962 metres along 4 northing lines. All samples were submitted to Assaycorp for 50 gram fire assay, quartz-flush analysis. Drill hole collar information is presented in Figure 2 and Table 1. Assay results and drill logs are presented in Appendix 1 and shown in Figures 3 to 6.

Three holes were planned to target the main reef, one north and two south of the open pit. All three holes intersected the mineralised zone, but returned low Au values with the best intersection in hole FD10 with 1.0 metre @ 0.81 g/t Au from 26.0 metres.

Drill holes testing the eastern reef returned anomalous Au, but well below economic grade, with the exception of a high-grade intersection in drill hole FD7 with 1.0 metre @ 12.6 g/t Au from 46 metres.

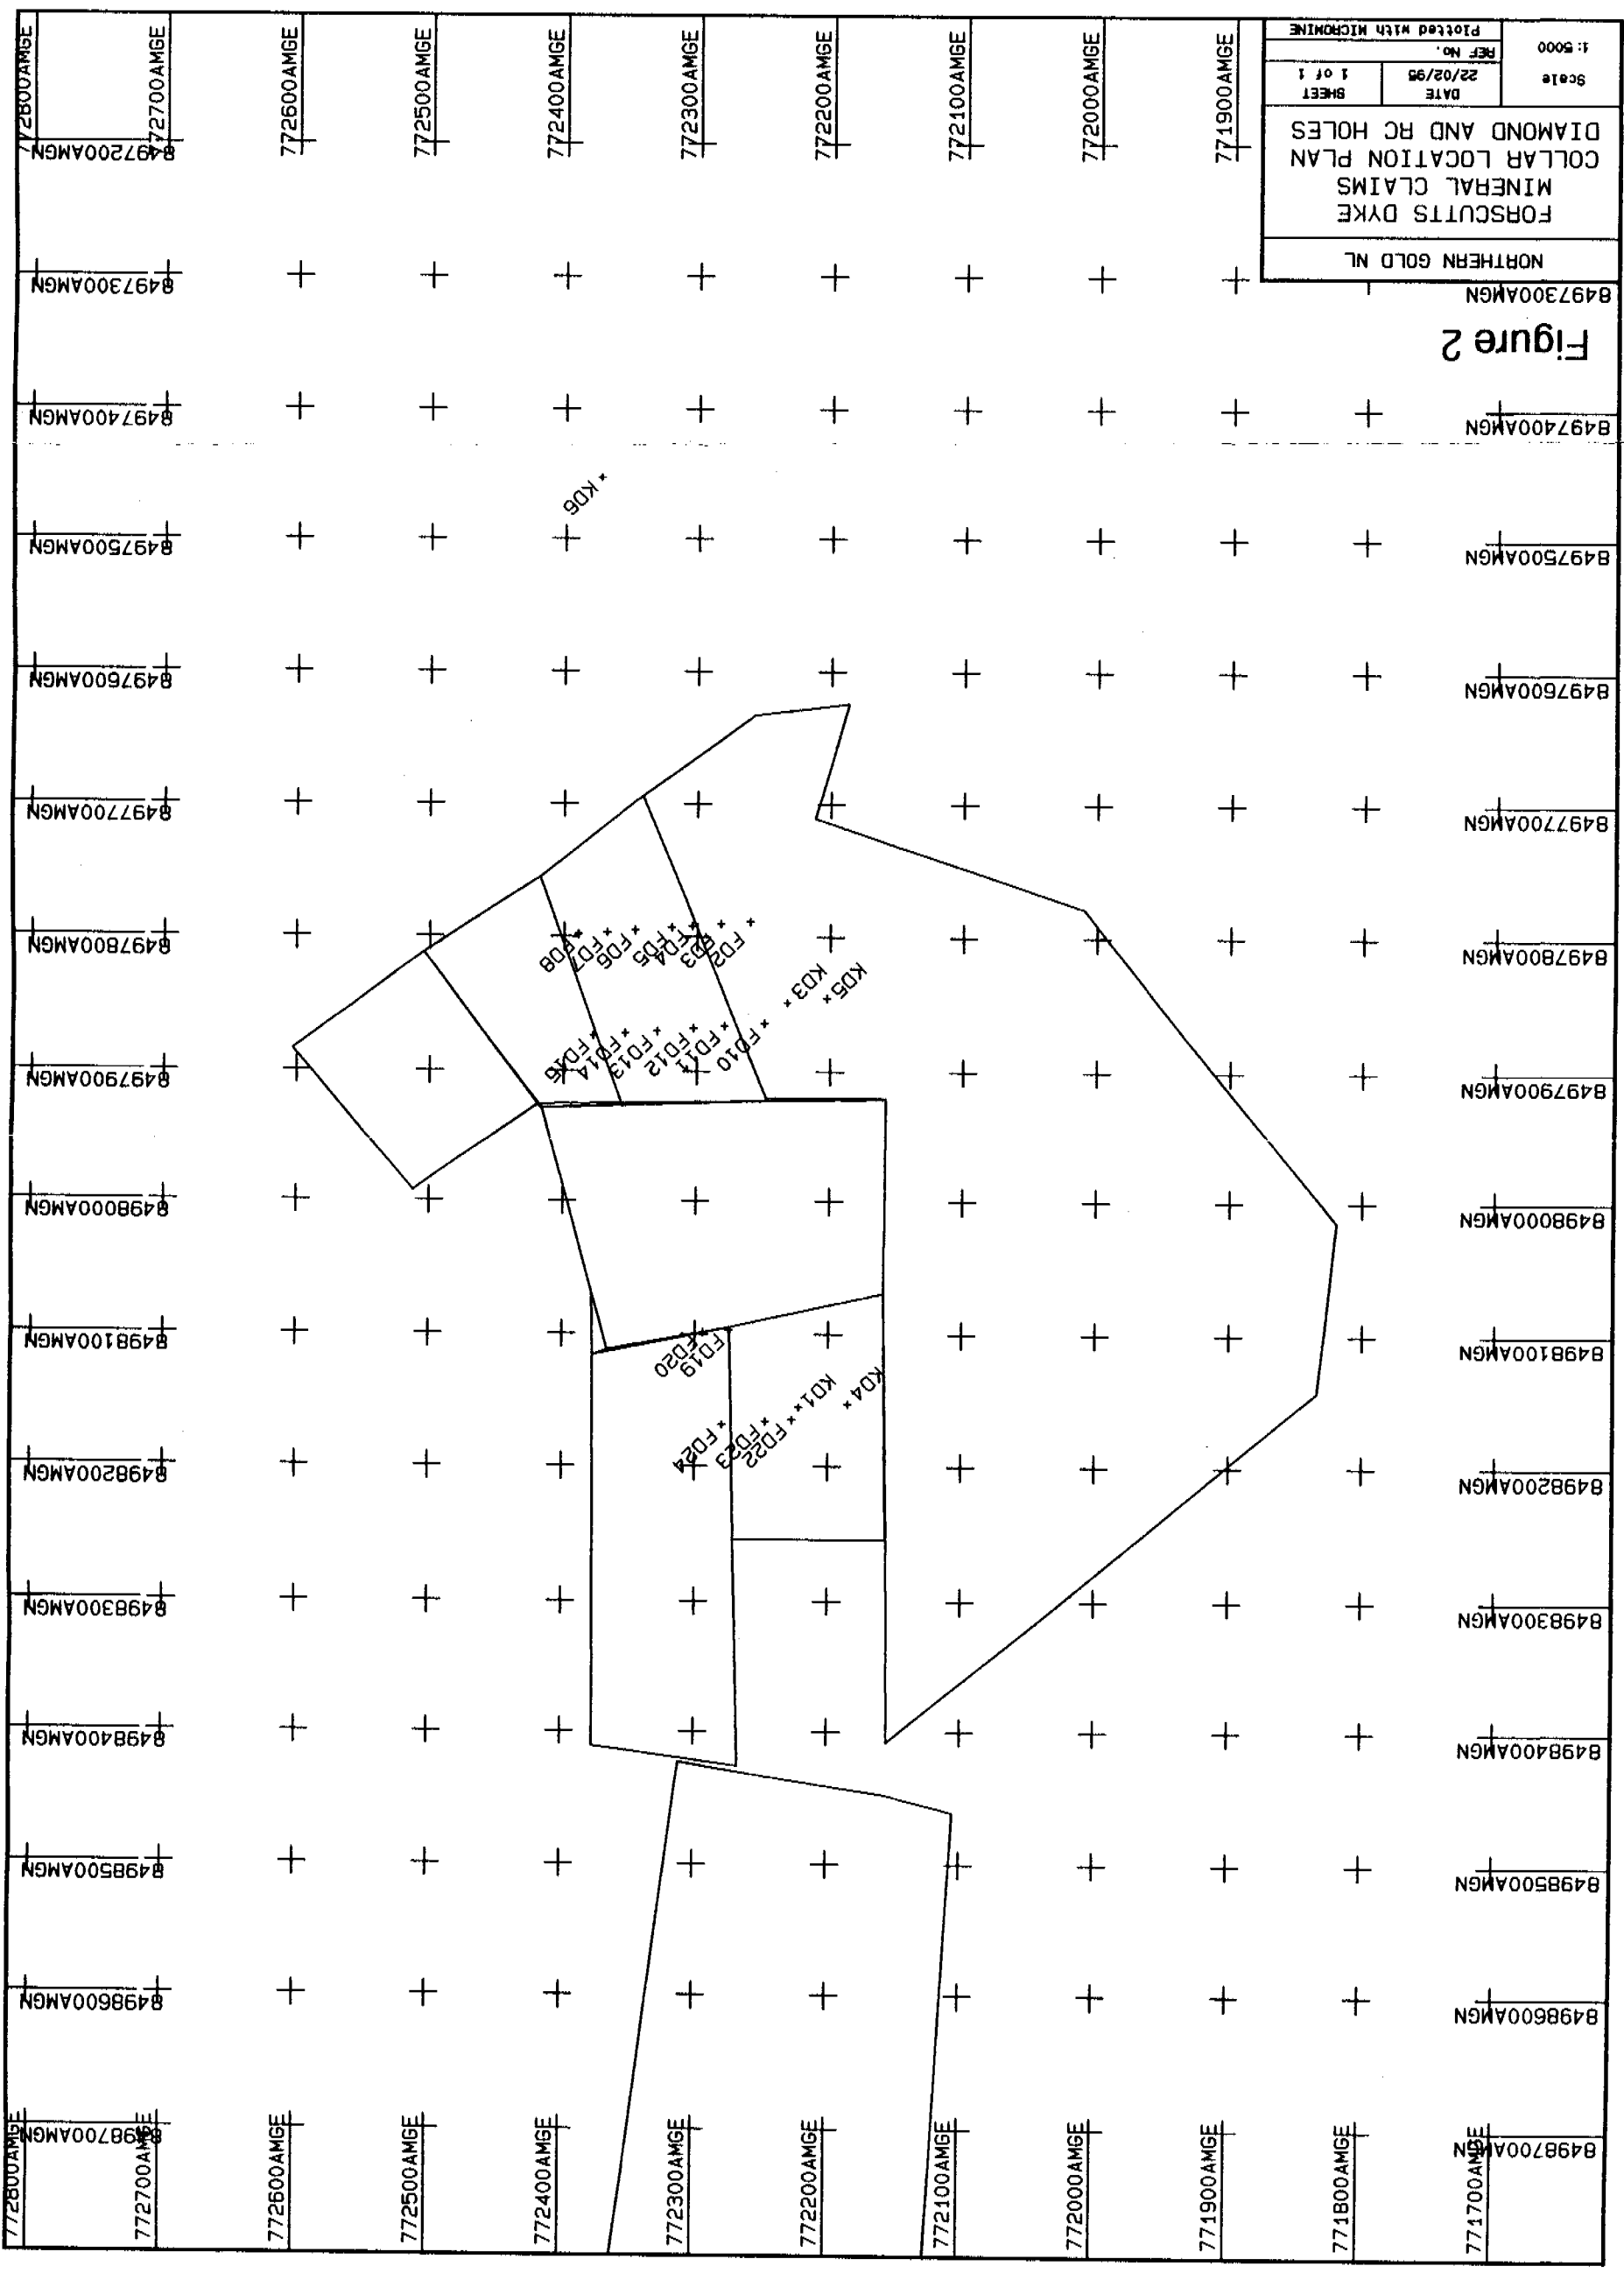

Drill testing of hanging wall mineralisation along metasedimentary-dolerite contacts proved to be marginally successful with intersections in FD3 with 1.0 metre @ 1.62 g/t Au from 33 metres and in FD4 with 3.0 metres @ 0.67 g/t Au from 28-30 metres.

3.3 Rehabilitation

Rehabilitation along the four cleared lines on the Forscutt mineral licences included removal and bag farming of plastic sample retention bags and sub-surface capping of holes.

4 CONCLUSIONS

Drilling on three lines north and south of the open pit at Golden Dyke, testing continuation of the main reef lode at shallower depths, has returned anomalous, but below economic grade, Au mineralisation. These results confirm Orridges (April 1987) conclusion that "major extensions of high grade open, pittable ore, comparable to that worked in the pit, are unlikely".

Similarly, all holes on the two lines targeting the Eastern reef gave results below ore-grade and confirm earlier suggestions by Orridge (April 1987) that these parallel lodes are generally less mineralised than the main reef.

Drill testing of hanging wall mineralisation along metasedimentary-dolerite contacts proved to be marginally successful but below economic grade.

Although most holes returned anomalous Au mineralisation the results are below economic grade. However they are sufficient to explain previously reported soil and rock chip anomalies.

5 RECOMMENDATIONS

On the basis of previous exploration efforts and this program, it appears unlikely that shallow extensions of ore-grade Au mineralisation in the main reef carry into the Forscutt mineral leases, both north and south of the open pit. Similarly, mineralisation along the eastern reef is sub-ore grade and it is recommended that no further exploration be conducted targeting shallow extensions of the main reef, or the eastern reef on the Forscutt mineral licences.

A final exploration effort targeting a possible down-pitch extension of mineralisation along the main reef, south into the Forscutts ground, would require a relatively deep diamond hole. However, because of the large strip ratios to access mineralisation at depth, it is probable that any extensions to the Golden Dyke mineralisation would be uneconomic at the present gold prices. It is therefore recommended that no further exploration be carried out targeting the main reef unless the gold price increases significantly.

Recent scout RC drilling at the Davies N*1 prospect MCN 4267, directly north of MLN 914, has identified a narrow, high grade zone of gold mineralisation, hosted by carbonaceous shales of the Koolpin Formation. This sequence of carbonaceous shales passes south from MCN 4267, across the central and eastern side of MLN 914, and is reported as anomalous soil and rock chip results in Orridge (April 1987). This area will be the focus of further mapping, soil and rock chip sampling, leading to scout RC drilling in the 1995 field season.

6 EXPENDITURE

Expenditure on MLN 497-917 during 1994 tenure totalled \$52,593. Details of this expenditure are listed below as Table 2.

Site Preparation	\$2,718
Field Expenses & Consumables	\$640
Assays	\$7,680
Drilling	\$28,161
Drafting and Computing	\$792
Report Preparation	\$136
Motor Vehicle Costs	\$1,880
<u>Wages and Salaries</u>	<u>\$3,726</u>
<u>SUBTOTAL</u>	<u>\$45,733</u>
15% NT % Head Office Administration	\$6,860
<u>TOTAL</u>	<u>\$52,593</u>

Table 2

7 PROPOSED WORK PROGRAM

Follow-up work will include detailed soil sampling and RC drilling.

Assays detailed soil sampling	\$1,000
Assay rock chipping	\$300
Drafting and Computing	\$500
Report Preparation	\$500
250 metres of RC Drilling	\$8,750
Site Access	\$1,500
Assays	\$2,500
Salaries and wages	\$3,000
TOTAL	\$18,050
