Considering the amount of sampling done on lease to date and
the general confirmation of mineral values from the property
of assay, it seems enough has been
done in that respect.
Some of the more recent work done to date includes some
gold sampling in the west corner of the Lease.
This area is near the Dosun Peg and samples were taken
of gravel at bed rock, the larger rocks screened and from
visual.
All times a significant number of gold specks, but usually
these were fine and would not indicate a reasonable deposit.
The Gold seems to be obviously present from exposure of old
alluvial gold from the nearby deposit workings covering
a fairly large area of the northern section of a slightly
eastern flat. The material present being carried from the
Union reef, sourced from creek nearby.
