SUMMARY

Exploration Licences 7636, 7712 and ERL 85 are located approximately 25 kilometres east of Tennant Creek and are being explored as a single Project Area following permission to do so from the NTDME. This is the first Project Status Annual Report on the three tenements; the ELs were granted in 1992 and the ERL in 1988.

A 500 x 500 metres gravity survey covered almost the entire Project Area and several strong gravity trends were found encompassing nearly all known ironstone bodies. Several gravity highs do not have known ironstone occurrences associated with them.

South of the Gigantic ironstone and workings, geological mapping and rockchip sampling found numerous small ironstone bodies which are variably Au, Cu and Bi anomalous. Single lines of lag sampling over these bodies and to the west of Metallic Hill confirmed and re-inforced the geochemical anomalism.

The grided and mapped area was covered with a 40 x 10 metre ground magnetic survey.

A kinematic GPS survey was conducted over the Gigantic and nearby ironstones and levelled a grid line to the south.

Dipole-dipole IP was conducted over two ironstone areas between Gigantic and Metallic Hill - namely 'Fairway' and 'Gossan Hill'. Weak anomalies are evident, the significance of which has yet to be fully determined.

Four RC percussion drill holes were put into the Gossan Hill outcrop and one into the Fairway area. The Gossan Hill holes found a strong chlorite-talc lode with haematite-magnetite stringers, but no significant gold or copper assays were returned. A single hole into the Fairway area found no lode, but magnetic sediments and a magnetic lamprophyre was intersected. Both areas probably warrant further consideration and possibly further drilling.

Expenditure being reported here totals $183,170.

1. LOCATION

The three tenements which are the subject of this report form a contiguous block which lies approximately 25 kilometres east of Tennant Creek (Figure 1).

Access is via a four wheel drive track originating near the Tennant Creek microwave repeater and which then follows the 'Lone Star' trend of workings to the 'Gigantic' workings. At the 'Gigantic' the track splits to the south (eventually returning to Nobles Nob), east (to the Gum Ridge trig point) and north-east.

2. TENURE

Exploration Retention Lease 85 was granted to N. Byrne and Associates Pty. Ltd. on 16th December, 1988 for a period of 5 years. It subsequently became part of the Tennant Creek Joint Venture between Western Mining Corporation Limited (WMC) and Giants Reef Mining Pty. Ltd. (GRM) with the former acting as Manager and Operator. ERL 85 was granted to cover the prospective 'Gigantic' ironstone and workings which at that time lay within EL 4820.

EL 7636 (Gigantic East) of 9 blocks (26 km^2) was granted to WMC and GRM on the 13th of March 1992 for a period of 6 years. The EL was applied for to cover the easterly extension of the Gigantic ironstone system and other prospective areas which had not previously been explored by the JV.

EL 7712 (Gigantic West) of 9 blocks (26 km^2) was granted to WMC and GRM on the 4th of June 1992 for a period of 6 years. The EL was applied for to cover some of the area of former JV tenement EL 4820, which it was felt had not been adequately explored by the time it expired in November 1991.

As the three tenements constituted a contiguous block covering closely related geological entities application was made to the NTDME for Project Status for the three tenements to allow exploration and reporting in a more efficient and geologically meaningful way. Project Status was granted on the 23rd of September 1992 and a common reporting date of 13th of April established.

3. REGIONAL GEOLOGY

The regional geology of the Tennant Creek field has been detailed in many recent publications and will not be repeated here. Papers contained in AusIMM Monograph 14 (Geology of the Mineral Deposits of Australia and Papua New Guinea), Volume 1, pp 829-861 would give the reader an excellent introduction to the regional geology and style of gold-copper mineralisation of the area.

The Northern Territory Geological Survey is currently re-mapping the Tennant Creek area and a pre-publication version of the Tennant Creek 1:50,000 sheet is given as Figure 2. Note that the stratigraphy utilised in this mapping has been considerably modified from that used by Le Messurier et al (1990).

4. LOCAL GEOLOGY

The geology of the tenement block is moderately well exposed. Most readily accessible is the prominent ridge of ironstone and sediments which hosts the 'Gigantic' workings. Surface mapping delineated a easterly plunging anticline, with numerous small scale folds on its flanks. The ironstone here appears to lie within a particular horizon and has clearly been involved in the folding event. Gold at the Gigantic appears grossly to be related to the axial position of the anticline and certainly was hosted in the sediments as well as the iron oxide rich areas.

To the east of the Gigantic ironstone a small hill of massive haematite (lesser magnetite) was called 'Explorer 211' by Geopeko. This is an isolated outcrop and is surrounded by recent alluvial and colluvial deposits of unknown thickness. Further to the east the Gum Ridge marks the limit of Cambrian sediments unconformably overlying the Proterozoic Warramunga Group. Drilling by Geopeko has intersected the Proterozoic beneath the Cambrian and ironstone-style lode alteration.

To the immediate west and north-west of the Gigantic, several magnetic ironstone bodies have been mapped by traditional methods and geophysics. The Giant Moon and Rising Moon ironstones have been drilled by the current JV. No economic mineralisation has been defined, but interesting lode alteration is encouragement enough to warrant further work.

South of the Gigantic, a wide plain underlain by haematitic wackes and siltstones of the Warramunga Group are pierced in many places by small to moderate sized ironstone (chiefly haematite) bodies. The Blue Moon and Metallic Hill workings (not held by the JV) have yielded small but high grade tonnages of gold ore. Up to 10 other ironstone occurrences have been found so far within the JV tenements. East-west striking anticlinal structures have been mapped across at least several of them. Magnetic patterns indicate the presence of north-east striking magnetite-destructive structures, possibly of the same family as the Quartz Hill Fault.

5. SELECTED PREVIOUS WORK

The area currently under report has been held under numerous titles previously.

Many companies have explored around the Gigantic workings. This work was summarised by Byrne (1987) and the summary reproduced here -

Australian Development Limited - surface and underground drilling

Bureau of Mineral Resources - Airborne and ground magnetics, surface chip sampling, wagon and diamond drilling

C.R.A. Exploration - gravity and magnetics surveys, underground sampling and surface diamond drilling

Inter-Copper N.L. (Geotechnics) - ground magnetic survey, geochemistry, I.P. survey, diamond drilling

Minefields Exploration - griding, geochemistry, ?drilling

Marathon Petroleum Australia Limited - gravity and magnetics surveys, geochemistry, percussion drilling

United Uranium N.L. - drilling

Uranerz Australia Pty. Ltd. - magnetic and radiometric surveys, geochemistry.

Much of this work has been summarised onto maps and submitted in Annual Reports for EL 4820. The work of Marathon/Uranerz, CRAE and Geopeko will be reviewed in some detail here.

Uranerz Australia, then Uranerz in JV with Marathon Petroleum explored EL 1745 between 1978 and 1981, with uranium being the chief target.

In the first year, geological mapping, ground magnetics and scintillometry was undertaken, mainly over the Metallic Hill workings; sampling was also undertaken around the Blue Moon Mine. Some +10 g/t analyses were won from around the Blue Moon (Anonymous, 1979).

In subsequent years additional sampling ('base of slope' and soils) was undertaken in the vicinity of the Metallic Hill, Blue Moon and Gigantic workings, RAB drilling (17 holes 831 metres) in the vicinity of the Gigantic Mine (McPhee, 1981a), RC percussion drilling (5 holes for 660 metres) at Blue Moon and ground magnetic and gravity traversing the Gigantic, Rising Moon, and Blue Moon areas. Three diamond drill holes tested the Rising Moon anomaly with disappointing results (McPhee, 1981b).

In 1981 old BMR diamond drill holes BMR3 and BMR4 were accessed, sampled and analysed for a suite of 22 elements (McPhee 1981c). No significant anomalism is evident in the data, but they have not been plotted up in any systematic manner as yet.

CRAE held EL 4453 and Mineral Claim C4 over the Gigantic Mine workings in the mid 1980s. Harvey (1984) summarised prior work on MCC4 at the Gigantic workings, geological mapping (1:1,000), a grid and level survey, ground magnetic survey (5 x 50 metres), gravity survey (25 x 100 metres), geophysical modelling and diamond drilling. No significant gold assays were won.

Harvey (1985) reported on mapping and geophysical surveys on EL 4453 which were extensions of the surveys on MCC4. No drilling was done on the EL.

Geopeko held EL 4536 in the late 1980's which covered a large area mainly east of the Stuart Highway. Within or adjacent to the area of current interest, Geopeko conducted the following work -

a) At Explorer 211, which is a small ironstone hill about 1 kilometre east of the Gigantic workings, they conducted ground magnetics and drilled a single RC percussion hole under the outcrop (PDH 1) (Love 1986). This hole failed to intersect any lode and a planned follow up hole designed to scissor under the outcrop was not drilled.

b) At Metallic Hill ("TC I, Anomaly 18"), about 3 kilometres south of the Gigantic workings, several ground magnetic traverses (plus geological mapping and rock chip sampling) were followed up with two RC percussion holes sited close to the old Metallic Hill workings. Minor low grade gold intersections were won. Metallic Hill is currently held under Mineral Claims and is being explored in a North Flinders Mines - PosGold JV.

c) At Explorer 195 ('Gum Ridge') (Balind 1987, Love 1989) ground magnetic surveys were followed by the drilling of several diamond drill holes which intersected weakly mineralised lode and thin ironstones. Lead isotopic measurements were made on the initial hole and were found to be encouraging. Down hole magnetometry was also used. The anomaly is currently excised from EL 7636 as a mineral claim held by others.

6. WORK UNDERTAKEN DURING THE YEAR

6.1 GRIDING

At the commencement of the year, existing grids in the area consisted of -

a) WMC grid over the Gigantic mine area. This was pegged in 1988 oriented AMG North-South off a CRAE datum at 7 834 035 N, 436 795 S. Local grid co-ordinates were used.

b) Geopeko grids over the Explorer 211 outcrop and over outcrops to the south, leading up to Metallic Hill. These grids were in very poor condition.

This year, an entirely AMG grid was pegged between the Gigantic Mine area and Metallic Hill and also over the Explorer 211 outcrop. The CRAE AMG datum was again used; the grid was pegged using a combination of EDM/staff and topofil/compass with lines 40 metres apart and pegs 50 metres apart along the lines (Figure 3). Certain grid points were later surveyed in using kinematic GPS (Section 6.2).

6.2 KINEMATIC GPS SURVEY

In order to establish accurate levels for later gravity surveying the firm of Haines Daish Haines of Adelaide were contracted to give kinematic GPS derived AMG co-ordinates and AHD levels over the Gigantic Mine area (lines 1660 E, 1800 E, 1900 E and 1000 N), plus the Giant Moon and Explorer 211 areas and along the new grid line 7 833 000 N. The Gum Trig was used as the control point for the survey.

The results of this survey are presented in Appendix 1.

6.3 GEOLOGICAL MAPPING AND ROCK CHIP SAMPLING

The AMG grid between the Gigantic and Metallic Hill mine areas was mapped and rock chip sampled.

A number of small to medium sized ironstone/jasper outcrops were found and sampled. Figures 4 - 8 show the geological mapping; rock chip descriptions are given in Appendix 2 and assays in Appendix 3.

The area mapped basically consists of occasionally outcropping haematitic wackes and shales with sheets of quartz scree probably marking areas of vein arrays. Occasionally the sediments are strongly laminated and cleaved and may be described as 'haematitic shale', somewhat in the traditional Tennant Creek fashion.

Revised			

Piercing the fairly flat plain are eight outcrops with compositions varying from jasper/haematite to haematite/magnetite/carbonate to haematite/quartz ('dalmatianite'). The outcrops vary in size from a few cubic metres to the size of a small building.

The outcrops immediately to the south of the Gigantic workings were named the Fairway area; whilst a knobby hill just north of Metallic Hill was called Gossan Hill (Figure 3). Some of the Fairway outcrops were found to be moderately copper and/or bismuth anomalous and the 'Fairway 2' outcrop returned 20 ppb gold in rockchips. The Gossan Hill outcrop is strongly copper-bismuth anomalous (especially within the carbonate gossanous zone).
Very little structure could be accurately determined from within the mapped area (no attempt was made at the time to link in the geology of the Metallic Hill and Blue Moon areas); however clearly an east-west striking antiformal structure passes through Gossan Hill and minor haematite rich accumulations, found on outcrops to the east and west of that feature, also trace out the antiform.

Additional structures (magnetite destructive) can be traced within the ground magnetic data.

6.4 GEOPHYSICS

6.4.1 Ground magnetics

A ground magnetics survey was undertaken over the 1992 grid. A Scintrex MP3 magnetometer was used, with a 3 metre sensor height. Stations were 10 metres apart on the 40 metre spaced lines. Drift of the magnetic field was measured by way of a base station magnetometer at 7 834 012 N, 437 132 E, cycling every 30 seconds.

The ground magnetic contours are presented in Figure 9 and the data is given in digital format in Appendix 4. This includes data read in 1988 and 1989 over the Gigantic/Giant Moon/Rising Moon areas.

The survey delineated weak to moderate dipolar responses over nearly all of the ironstone/jasper outcrops. The skewness of the dipoles indicates a significant remanence component. A weak magnetic high is located between the ironstone outcrops in the Fairway area. It was thought that this may represent a relatively shallow, oxidised slab of ironstone connecting the ironstone outcrops. The 'bulls eye' response over the Gossan Hill prospect qualitatively resembles that due to a steeply dipping cylinder rather than a body with any significant strike component.

6.4.2 IP survey

Dipole-dipole IP/resistivity surveys were carried out over the "Fairway' and 'Gossan Hill' prospects to test the possibility of electrical responses associated with the magnetic sources. Dipole lengths were 100 metres and levels n=1 to n=6 were measured on both spreads.

Field equipment manufactured by Zonge Engineering was employed, in particular the GDP16 receiver and GGT30 transmitter. The equipment was operated in the Complex Resistivity mode at a base frequency of 0.125 Hertz.

Digital data for the surveys is given on disk in Appendix 5.

The targets for this survey were known to be small and possibly deep; quantitative modelling has not been undertaken and would probably require three dimensional models.

Line 437080 E - Fairway
Electrical data from the Fairway prospect is presented as three-point EM decoupled data (Figure 10), first harmonic phase (Figure 11) and third harmonic phase (Figure 12).

Phase data in Figure 10 are noisy, but data in Figures 11 and 12 show coherent anomalies. Polarisable resistive sources evidently occur near 7 833 100 N, 7 832 850 N and possibly near 7 832 600 N. The first of these coincides with the northern-most magnetic outcrop at Fairway; however no good information is to hand for the other two areas.

Line 437480 E - Gossan Hill
The 3 point decoupled phase pseudosection (Figure 13) shows slightly elevated values in a pant-leg pattern consistent with the response of a weakly polarisable, electrically resistive body. This responder coincides with a strong highly localised 'bulls eye' magnetic anomaly over the outcropping Gossan Hill ironstone.

Further to the north at about 7 832 500 N, 437 480 E the phase pseudosection (Figure 14) suggests another resistive polarisable body which is a weak responder but no weaker than the known ironstone mentioned above.

Resistivity highs apparently coincide with both phase anomalies and it is suspected that these are caused by bedrock topographic highs.

6.4.4 Sub regional gravity survey

A 500 x 500 metre sub regional gravity survey covered most of the tenements under report in early October 1992. A LaCoste-Romberg G747 gravity meter was used in conjunction with three digital barometers. Comparison to levelled survey points found that the barometer elevations were precise to ±1 metres, and often better than < 1 metre. AMG position was controlled using a MAGELLAN NAVPRO GPS unit using version 5000 software. For part of the survey, 'Selective Availability' was turned off and positioning to ±5 metres was achieved. At other times, precision of ±40 metres was found, when compared to fixed survey points.

A gravity base station at 7 833 002 N, 437 200 E was used, with an elevation of 302.19 metres and a gravity value of 978536.56 mgals. This base station has been tied into the BMR base gravity station at Tennant Creek airport via WMC's base station to the north of Threeways.

The digital data are presented on disk in Appendix 6. Included are AMG and latitude/longitude co-ordinates, observed and bouguer gravity, time and GMT time shift, earth tide data and elevations. Bouguer gravity is presented in contour form in Figure 15 and residual gravity in Figure 16 (ie with a regional gravity gradient removed).

Very clearly in the residual gravity map a gravity ridge of about 1.5 mgals traverses the tenement block with an approximately east-west strike. In the far east and south-east portions of the survey, elevated gravity may be reflecting insufficient corrections for topography or effects due to cover rocks. This will be investigated further.

Prominent gravity highs coincide with the Gigantic/Giant Moon and Fairway ironstone groups; the Blue Moon ironstone lies on the ridge but not directly over a high.

The presence of several other gravity highs to the west of Gigantic is very encouraging. These are not obviously associated with elevated magnetic responses, but this is not necessarily a downgrading feature.

6.5 LAG GEOCHEMICAL SURVEY

Most of the ironstone outcrops lying between the Gigantic and Metallic Hill workings ('Fairway' outcrops and Gossan Hill), the western flank of Metallic Hill and the Explorer 211 ironstone to the east of Gigantic were tested with single lines of lag sampling.

Each of the geochemical traverses was centred over a small ironstone body or a zone of quartz veining in ferruginised siltstones. The sample spacing along the lines was 25 metres. Samples (approximately 500 grams) of lag were been collected by sweeping the surface with a broom into a dust-pan and then sieving to -6+2 mm. The sieved samples were placed in calico bags and forwarded to the Western Mining Corporation Laboratory for analysis.

At the laboratory the entire sample was pulverised. Sub-samples were taken for digestion using hydrofluoric acid followed by leaching with dilute hydrochloric acid. Ag, As, Bi, Co, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Sb, and Ba were determined by means of ICP-MS analysis. Zn was determined by A.A.S. A 5 gram sub-sample also was analysed for Au by A.A.S. following an aqua regia digestion and pre-concentration.

The full assay results are presented in Appendix 7. The sample locations and results for Au and Bi have been plotted at 1:2,500 and are given in Figures 17 - 28. Profiles for Au, Bi and Cu are given in Appendix 8.

6.6 RC PERCUSSION DRILLING

6.6.1 Fairway prospect

Testing the possibility that the modest, broad magnetic high lying between several of the Fairway area ironstone outcrops could be sourced by an oxidised slab or ironstone, a single RC percussion hole was drilled vertically into the response. Initial three dimensional magnetic modelling of the slab scenario yielded a depth to source of between 80 and 120 metres.

Table 1 gives details of the drilling at both Fairway and Gossan Hill (section 6.6.2).

TABLE 1 RC PERCUSSION DRILLING AT FAIRWAY/GOSSAN HILL 1992

HOLE NO.	NORTHING	EASTING	DIP	AZIMUTH	METREAGE	NOTES
TCGC 28	7 831 985	437 480	-60°	176°	0 - 101.0 m RC	1
TCGC 29	7 831 990	437 520	-60°	176°	0 - 100.0 m RC	2
TCGC 30	7 831 958	437 520	-60°	176°	0 - 78.0 m RC	3
TCGC 31	7 832 995	437 120	-90°		0 - 150 m RC	4
TCGC 32	7 831 960	437 480	-60°	176°	75.0 - 90.0 m RC	5

NOTES :
1. Undercut to TCGC 32, Gossan Hill.
2. Test Gossan Hill lode to east.
3. Undercut to TCGC 29.
4. Test Fairway magnetic high.
5. Test beneath Gossan Hill.

Geological logs for the drilling are given in Appendix 9 and assays in Appendix 10.

TCGC 31 was drilled to 150 metres and failed to intersect either ironstone or lode alteration. The broad magnetic high appears to be sourced from a combination of magnetic sediments and magnetic, coarse grained biotite lamprophyre which was intersected in several extensive intervals below 100 metres (although a model has not yet been calculated to check this conclusion). Magnetic suceptability measurements taken on percussion chips are given with both the sample assays and geological logs in the appendices

XRD analyses of the lamprophyre at 105 and 125 metres downhole show that the rock consists mainly of K feldspar, biotite and quartz, with lesser talc and chlorite alteration. XRD results from all the RC drilling at Fairway/Gossan Hill are given in Appendix 11.

6.6.2 Gossan Hill prospect

Four RC percussion holes were put into the Gossan Hill ironstone outcrop/magnetic anomaly. These were designed to test the geometry of the ironstone system and extent of copper anomalism found in rockchips. It was also hoped to pick up some gold anomalism or significant assays. At the time of drilling the results of the IP survey were not to hand.

TCGC 28 and 32 were drilled directly underneath the hill and TCGC 29 and 30 were drilled down its eastern margin. All holes intersected chlorite ± talc ± dolomite alteration lode and magnetite-haematite stringers, but no massive ironstone was found.

Anomalous assays were returned from several intervals, mainly corresponding to talc alteration ± magnetite-haematite stringer zones. Best assays were 0.49 g/t Au near the bottom of TCGC 28, and 0.59 g/t Au in TCGC 30. Copper assays were all below 1% although several significantly Cu-Bi anomalous zones are present within the lodes.

The four Gossan Hill drill holes are shown in cross section in Figures 29 and 30.

6.7 ABORIGINAL SACRED SITES SURVEY

During the year an Aboriginal Sacred Sites survey covering the entire project area was commissioned from the Aboriginal Areas Protection Authority. A single site was found.

7. EXPENDITURES

7.1 ERL 85 GIGANTIC

The following expenditure has been recorded against ERL 85 over the fourth year of tenure (December 16 1991 to December 15 1992) :

	$
GEOLOGY	16,542
GEOPHYSICS	5,350
GEOCHEMISTRY	1,038
DRAFTING	2,309
SURVEYING	2,149
ANALYTICAL	2,545
DRILLING	0
LEASING	7,704
ADMINISTRATION	876
TOTAL	**$38,513**

In addition, the following expenditure has been recorded from December 16 1992 to March 13 1993 (Project anniversary date):

	$
GEOLOGY	1,078
GEOPHYSICS	3,614
GEOCHEMISTRY	670
DRAFTING	0
SURVEYING	283
ANALYTICAL	0
DRILLING	0
LEASING	7,081
ADMINISTRATION	48
TOTAL	**$12,774**

7.2 EL 7636 GIGANTIC EAST

Expenditure on EL 7636 over the first year of tenure (ended 13 March 1993) may be broken down as follows:

	$
GEOLOGY	30,504
GEOPHYSICS	15,581
GEOCHEMISTRY	3,089
DRAFTING	279
SURVEYING	5,297
ANALYTICAL	2,923
DRILLING	31,075
LEASING	65
ADMINISTRATION	4,717
TOTAL	**$93,530**

This compares with the covenant for the lease in the year which was $10,000.

7.3 EL 7712 GIGANTIC WEST

Expenditure on EL 7712 for the 9 month period from date of grant to the Project reporting date was:

	$
GEOLOGY	19,759
GEOPHYSICS	9,042
GEOCHEMISTRY	3,243
DRAFTING	0
SURVEYING	2,774
ANALYTICAL	2,607
DRILLING	0
LEASING	345
ADMINISTRATION	583
TOTAL	**$38,353**

This compares with the covenant for the lease in the past year which was $15,000.

8. FORWARD PROGRAMS AND EXPENDITURES

8.1 ERL 85 GIGANTIC PROPOSED WORK PROGRAM AND EXPENDITURE FOR YEAR FIVE

With the completion of kinematic GPS derived levels over the Gigantic ironstone ridge, cross-sections of 1988 RC percussion drilling will be re-drawn and re-interpretations made. Preliminary analysis already indicates the probability of new, untested gold targets being generated. If drilling capacity is available, several RC percussion drill holes may be drilled to test these targets.

The sub-regional gravity survey has re-highlighted the prospectivity of the Gigantic - Giant Moon - Rising Moon area. It is probable that in-fill gravity will be read in this area, and merged with CRAE open file gravity data over the same area. This may lead to additional areas for drill follow-up.

Lag sampling on a grid basis will cover most of the 'Fairway/Gossan Hill' ground magnetics grid and hence will cover the 'Fairway 2' area within ERL 85.

A detailed aeromagnetic survey (80 metre flight lines, 60 metre senor height) will cover the entire ERL in the first half of the year.

The above program is expected to cost about $15,000

8.2 EL 7636 GIGANTIC EAST PROPOSED WORK PROGRAM AND EXPENDITURE FOR YEAR TWO

The Gossan Hill prospect and most of the Fairway outcrops lie within EL 7636. A grid lag geochemical sampling program will be undertaken over the 1992 ground magnetics grid. In-fill gravity will be read over prospective areas, especially over the Fairway and Gossan Hill prospects. Together with refined geological and regional magnetic interpretation, new RC percussion drilling targets are expected to emerge.

Interpretation of existing RC percussion drilling results will be integrated with the IP and gravity results and follow-up drilling is expected.

A detailed aeromagnetic survey (80 metre flight lines, 60 metre senor height) will cover the entire EL in the first half of the year.

The above program is expected to cost in the order of $15,000.

8.3 EL 7712 GIGANTIC WEST PROPOSED WORK PROGRAM AND EXPENDITURE FOR YEAR TWO

The sub-regional gravity survey read in 1992 highlighted several gravity highs in hitherto poorly explored areas of the EL. The anomalies will be ground located, grided and in-fill gravity read. Surface geochemical techniques will be employed if appropriate.

A detailed aeromagnetic survey (80 metre flight lines, 60 metre senor height) will cover the entire EL in the first half of the year.

RC percussion drilling may be used at suitable targets if their relative prospectivity is high.

The above program is expected to cost in the order of $20,000.

APPENDIX 1

RESULTS OF KINEMATIC GPS SURVEY

PT1-8a

Haines Daish Haines

satellite surveying and navigation consultants

23-6-92

Mr. Malcolm Ward
Western Mining Corporation
PO Box 114
Daw Park 5041
South Australia

SUBJECT - Kinematic GPS Survey of the Gigantic Region, Tennant Creek, N.T.

A Global Positioning System (GPS) survey using the kinematic technique was conducted in the above region on 20-6-92. The Gigantic Knoll was coordinated both horizontally and vertically along 3 existing grid lines running North/South (ie 1650,1800,1900) and 1 existing grid line running East/West (ie 1000).In addition to this survey, grid line 7833000n was occupied together with several occupations around the X211 area , the Giant Moon Rock area as well as the Eastern Knob area.

The Gum Trig., approx. 4km east of the Gigantic Region, was used as control for the survey. The vertical accuracy of this control station is known to within +/- 0.3m of the AHD thus all height values attained from the kinematic survey are within +/- 0.3m of the AHD.

Horizontal accuracy of the kinematic technique is better than +/- 5cm from Gum Trig. Several static baselines were measured throughout the survey to verify this.The relative vertical accuracy between the points measured in the Gigantic region is also better than +/- 5cm.

Richard Haines,
Geodetic Surveyor, for HDH Pty. Ltd.
