EL9195, covering 46 graticular blocks, was granted to John William Benger on October 2, 1999 for six years. Olympia Resources NL acquired an option to purchase EL9195 dated May 1999, which expires on 30 June 2000. EL9195 is being explored for Industrial Garnet resources. The main area of interest within the EL is the Plenty River which contains Almandine Garnet derived from the weathering of the Riddoch Amphibolite and the Irindina Gneiss. No work was carried out in the relinquished area in 1998-9. Previous work indicated low value-low volume garnet bearing sands of no commercial interest and therefore this section of the EL being 23 blocks was relinquished.
