EL9191 was granted to John William Benger on August 15 1995 for six years. Olympia Resources NL exercised an option to purchase EL9191 on 29 June 2000. EL9191 is to be explored for Industrial Garnet resources. The main area of interest within the EL is the Ongeva Creek which contains Almandine Garnet derived from the weathering of the Riddoch Amphibolite and the Irindina Gneiss. During the year ended 14/8/2000 this company has been working diligently to procure the necessary finance to fund the proposed feasibility study to be undertaken by Bateman Engineering Pty Ltd on the Harts Range Garnet Project. Accordingly, no work has been carried out on the ground of EL9191 during the year ended August 14 2000.
