SUMMARY

The three Mineral Claims which were allowed to expire at the end of 2001 formed part of a major claim block covering ground prospective for gold mineralisation. Within those claims, Dominion Mining and Compass Resources NL undertook regional exploration, with the more intense work being carried out in the three claims which expired.

TENEMENTS

All of the expired tenements were not renewed for the 2002 calendar year. MCN 2656 and MCN 2775 were originally granted to Minerals Resources Corporation Pty. Ltd., with Compass Resources NL acquiring these tenements as the result of a series of agreements. MCN 4528 was originally granted to Compass Resources NL.

LOCATION

The tenements are located approximately 15 kilometres bearing 75° from the Mt. Wells Battery, and can be accessed by dirt tracks from Mt. Wells, or from tracks leading north-northwest from the Frances Creek mines and dam. The location of the original claims is shown on Figure 2, which also shows the location of other Mineral Claims which were in this claim block. The claims have a common point at AMG 8502350 N, 8034020 E (1966 datum) which is also near the centre of the drilling undertaken.

GEOLOGICAL SETTING

The Watts Creek Mineral Claims cover a Lower Proterozoic sequence of sediments of the Pine Creek Geosyncline. These sediments were intruded by conformable dolerite-grabbro silts prior to deformation, regional metamorphism and batholithic granite emplacement. The gross structure is that of a tightly folded upright to slightly overturned anticlinorium. At least two periods of quartz veining appear to be associated with the deformation, the later one being more sulphidic in nature.

The oldest rocks present belong to the Wildman Siltstone Formation of the Mt. Partridge Group. These are overlain by sediments of the South Alligator Group and include the Koolpin Formation, the Gerowie Tuff and the Mt. Bonnie Formation. A slight unconformity is reported between the Wildman Siltstone and the Koolpin Formation in this area, however if it exists it is not obvious.

All those formations present are known to host stockwork and or sulphidic gold mineralisation in the Pine Creek Geosyncline.

PREVIOUS EXPLORATION AND PRODUCTION

Alluvial gold was extensively worked in the creek systems by Chinese miners in the period 1880-1900. However the area was renowned as being malaria infected and was probably not exhaustively worked because of the high number of fatalities. Small hard rock gold workings which are recorded as pre-1936 exist. A second attempt to work these auriferous reefs to the south of the leases was made by a Darwin Syndicate in 1962 but the syndicate was poorly funded and work amounted to little more than the reopening of small shafts.

Geopeko, in conjunction with Anaconda, carried out a multi-element stream sediment survey in the area in 1982. Inconsistencies in the gold assays required that analysis be repeated; this resulted in the apparent anomalies disappearing.

During 1986 and 1987 Dominion Mining Ltd., undertook exploration of the area when it was part of EL 4759.

MINERALISATION

Apart from the abundant alluvial gold workings, investigations have shown that multiple quartz veining and stockworking occur in sheared folds and parasitic fold axes, and these veins contain significant gold grades. Regionally, three main stockwork types have been identified: .

- (i) quartz vein stockwork in the medium to coarse grained blocky feldspathic sandstone; veins may be up to 10 cm thick.
- (ii) quartz vein stockwork in a purple-grey mudstone
- (iii) haematite-manganese rich quartz stockwork in bleached purplish-olive grey siltstone.

Type (i) above is present in the expired leases.

In addition ladder veining occurs in the more brittle sandstone units, with veining also present in Zamu Dolerite and the Koolpin Formation.

WORK COMPLETED IN TENEMENTS RELINQUISHED

Several phases of drill evaluation of the Main Ridge Prospect within the Claims were undertaken by Compass Resources NL. Twenty two drill holes numbered CMR 2 and CMR 3 (1993), CMR 5 to CMR 22 (1994) and CMR 31 and CMR 32 (1995) (Figure 1).

All assay and lithology logs from these results from holes completed in the relinquished tenements are appended. These results were also reported in previous annual reports on the entire claim block, viz. in 1993, 1994 and 1995.

REHABILITATION

No disturbance has been made since 1995.

Regionally, Compass Resources spent a great deal of time and money attempting to completely rehabilitate the entire claims block area following a large amount of unnecessary costeaning carried out by Dominion Mining. An access road to the Main Ridge Prospect has not eroded during the last 8 wet seasons, and it is believed it should not be touched as future explorers will require access to this prospect.

Standard cleaning up of drill sites and samples was undertaken.
