1.0 SUMMARY

In April 2001 Tanami Gold NL (TGNL) entered into a Joint Venture agreement with Gold Fields Australasia Pty Ltd (GFA) covering four exploration licence applications centred 100 kilometres southeast of the Granites Gold Mine. GFA could ultimately earn 80% equity in the joint venture tenements by free-carrying TGNL through to the acceptance of a bankable feasibility study.

Under the terms of the agreement GFA were committed to spend \$1.0million on exploration during Year-1 of tenure. In July 2001 GFA withdrew from the joint venture after spending \$1,029,701 on exploration.

This report summarises the work of GFA. on the relinquished portion of EL 10216

GFA as managers of the exploration program drilled a total of 769 RAB and Aircore holes for 28,643 metres and collected 7,686 composite drill samples over the four tenements. The objectives of the drilling were firstly to follow up unresolved geochemical anomalies discovered by the previous explorer, Sons of Gwalia Ltd (SOG) and secondly to undertake reconnaissance exploration of areas not targeted by SOG

Rock-types of the total project area are dominated by massive granitoids with amphibolites intruding a belt of metasediments and minor granitoids in the southeast sector. The northern part of the project area exhibits localised metasediments, which probably represent roof pendants to the granitoids or down faulted Tanami Complex lithologies.

The relinquished portion of EL 10216 is for the most part underlain by Archean basement gneisses which may be part of the Billabong Complex.

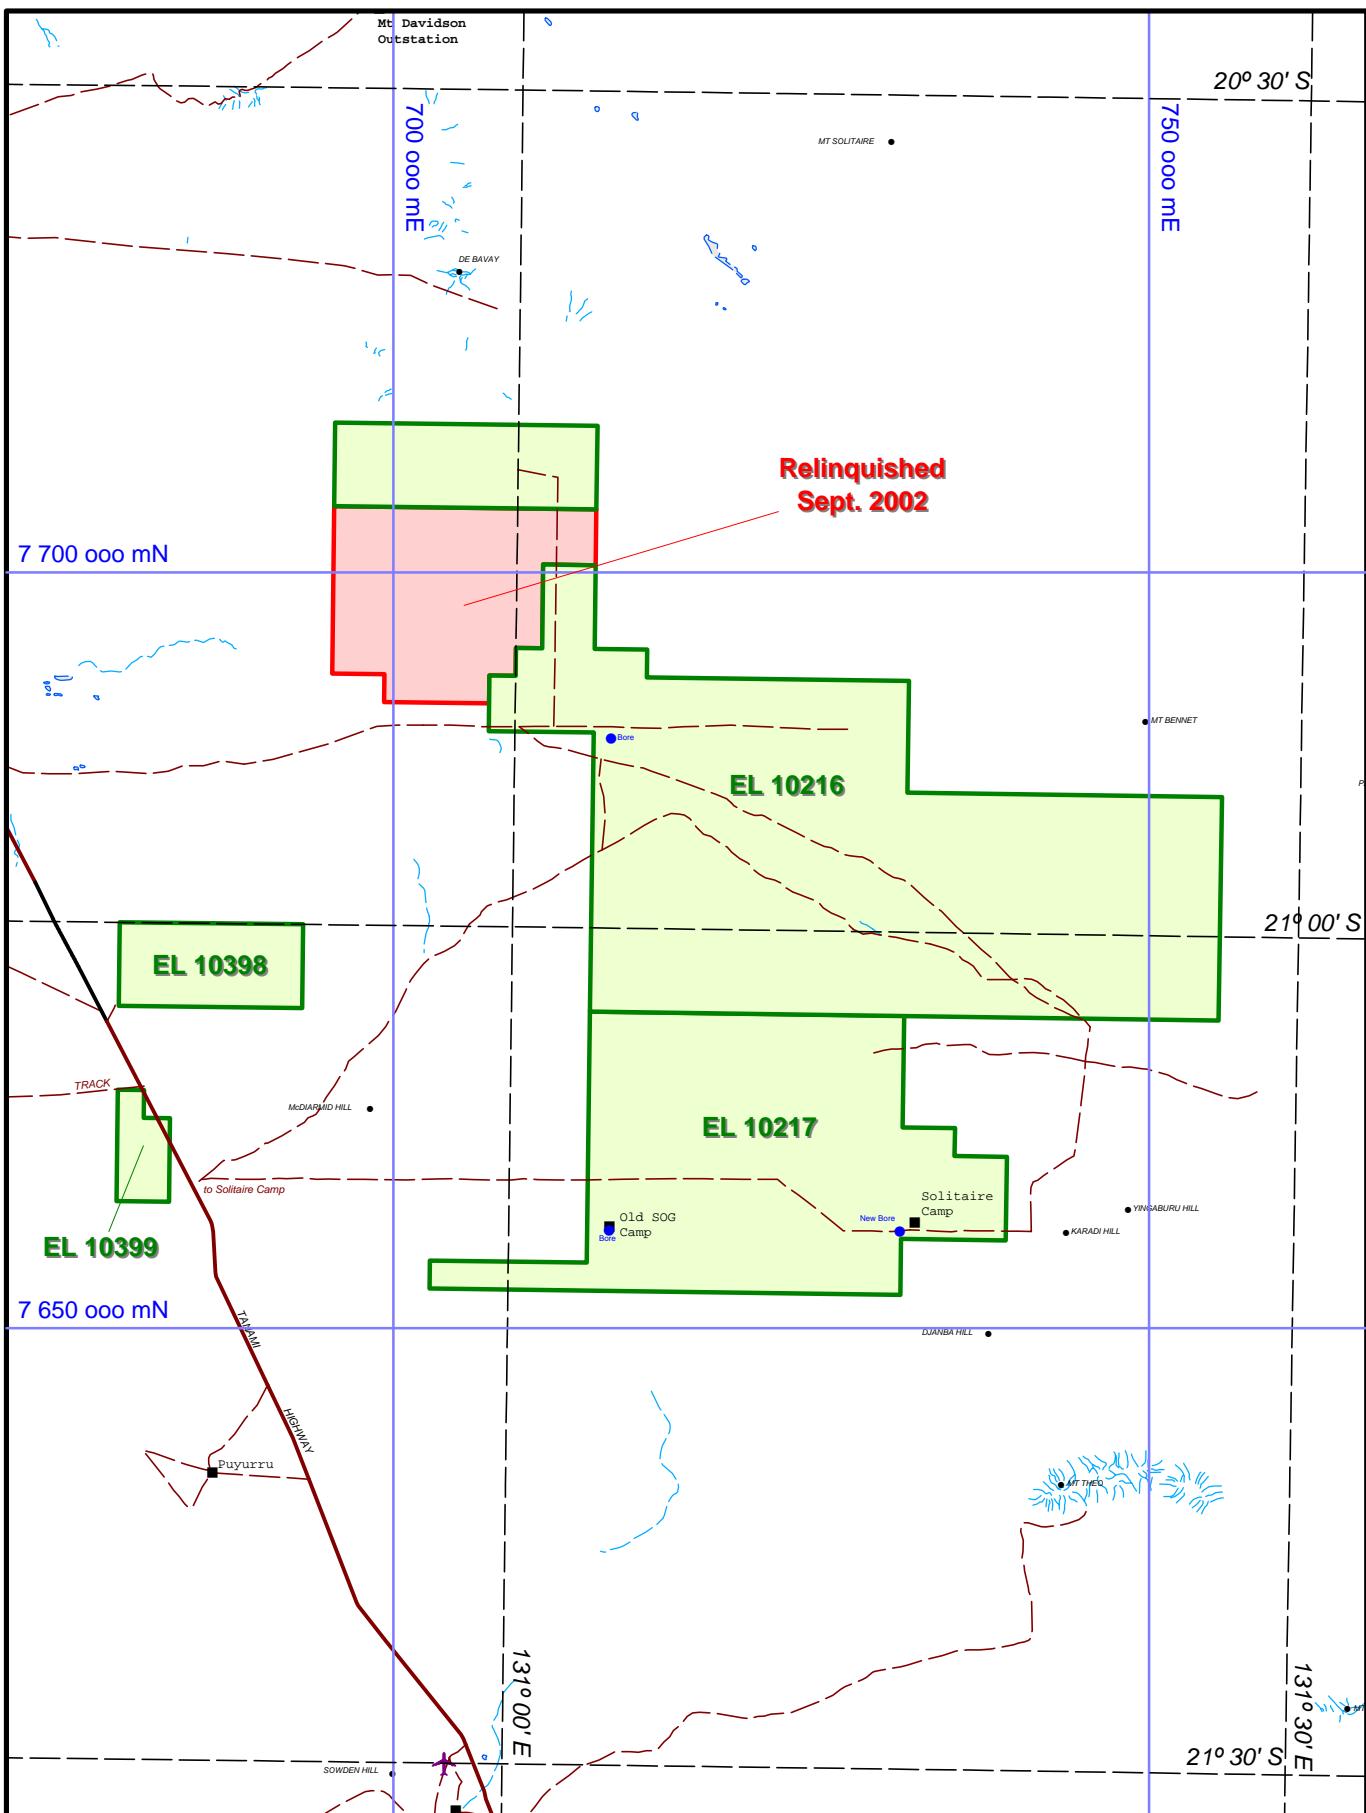

2.0 INTRODUCTION

The Solitaire Project is centred approximately 430 kilometres northwest of Alice Springs and 100 kilometres southeast of The Granites Gold Mine in the Tanami Region, Northern Territory (Figure 1).

The tenements lie on Aboriginal Land within the Central Desert Land Trust area. A Deed for Exploration between TGNL, the Central Land Council (CLC) and the traditional Aboriginal owners was signed in August 2000 and title was granted for the tenements on 27 September 2000. Approval of the proposed fieldwork by the CLC was progressively provided during the course of the field program.

Access to the project area is via the Tanami Highway. Access to the project is by one track leading east from the highway about 48 kilometres northwest from the Mt Theo turn-off and another leading northeast from the same point on the highway. A series of variable quality tracks, developed by the previous tenement holder were also utilised.

The terrain is almost flat and 40% of the area is occupied by a Tertiary to Recent paleodrainage up to 20km wide. Aeolian sand blankets the surface, leaving rare outcrops of lateritic capping, metasediments and occasional quartz blows to provide the only low hills in the project area.

3.0 TENURE

EL 10216 was granted to Tanami Gold NL on 27 September 2000. The tenement is on Aboriginal Land within the Central Desert Land Trust Area. The Company signed a Deed for Exploration for the four tenements comprising the Solitaire Project in August 2000.

The tenement was granted over 344 blocks and was due to be reduced to 172 blocks by 26 September 2002. Only 55 blocks were identified for relinquishment and a waiver was granted in respect of 117 blocks on 14 October 2002.

EL 10216	27.9.2000	34	114	\$13,050

4.0 EXPLORATION PROGRAM SUMMARY

Exploration within the relinquished portion of EL 10216 was carried out by GFA and was limited to lag sampling (7 samples); Aircore drilling (11 holes for 426 metres); RAB drilling (1 hole for 33 metres); and assay of 61 composite drill samples. No significant results were returned from lag sampling or the drilling.

Sample sites and drill hole locations are shown in Figures 2 to 4. Relevant collar data ,geological logs and assay results are given in Appendices 1 to 5. Analytical techniques are summarised in Table 2.

The relinquished portion of EL 10216 was covered by a low level aeromagnetic survey see Figure5. The digital data and survey specifications are given in Appendix 6.

Table 2: Analytical Details

5.0 REHABILITATION

Camps: Two camps were established by GFA both of which were outside the relinquished area of EL 10216. Rubbish from the southern camp was disposed of at The Granites Gold Mine and rubbish from the northern camp was disposed of in an excavated hole. The rubbish in this pit was progressively covered to prevent it from being blown away or distributed by animals.

Campsites were cleaned up after being vacated and everything was either removed or buried in the rubbish pit and then covered. Minor oil spills associated with the power generator at each camp were dug up and buried.

Access Tracks: Several access tracks into the project area were part of a network constructed by SOG during their exploration of their larger land holding. These were all used during the field program and the east-west access track from the Tanami Highway into the northern part of EL 10216 was cleared of vegetation regrowth by a loader. However because the track crossed deep, fine grained aeolian sand, it was still only marginally trafficable and was not used. The other tracks were in reasonable condition.

Drilling: Concrete hole plugs made from pot plant moulds were used to plug drill holes. They were inserted at the completion of each hole prior to the rig moving to the next drill site. They were bedded into position in the drill holes with a shovel handle and then covered with soil and/or drill cuttings to form a low mound to allow for compaction following rain and to prevent water pooling above the hole.

1 GENERAL SURVEY INFORMATION

In August 2000, UTS Geophysics conducted a low level airborne geophysical survey approximately 100km south-east of the Granites Mine for Goldfields Australasia Pty Ltd.

This report summarises the logistics, survey parameters and processing details of the survey.

The survey commenced on the 14th August 2000 and was completed on the 23rd August 2000.

UTS Geophysics provided the described survey for the following company:

Goldfields Australasia Pty Ltd

PO Box 628

WEST PERTH WA 6872

2 SURVEY LOCATION

The area surveyed was approximately 100km south-east of the Granites Mine in the Northern Territory. A survey location map is provided in Appendix C of this report.

The survey was flown using the AMG84 coordinate system (a Universal Transverse Mercator projection) derived from the Australian Geodetic Datum and was contained within zone 52 with a central meridian of 129 degrees. Details of the datum and projection system are provided in Appendix B of this report.

3 AIRCRAFT AND SURVEY EQUIPMENT

The UTS navigation flight control computer, data acquisition system and geophysical sensors were installed into a specialised geophysical survey aircraft.

The list of geophysical and navigation equipment used for the survey is as follows:

General Survey Equipment

- ? FU24-954 fixed wing survey aircraft.
- ? UTS proprietary flight planning and survey navigation system.
- ? UTS proprietary high speed digital data acquisition system.
- ? Novatel 3951R, 12 channel precision navigation GPS.
- ? Satellite transmitted differential GPS correction receiver.
- ? UTS LCD pilot navigation display and external track guidance display.
- ? UTS post mission data verification and processing system.
- ? Bendix King KRA-405 radar altimeter.

Magnetic Data Acquisition Equipment

- ? UTS tail stinger magnetometer installation.
- ? Scintrex Cesium Vapour CS-2 total field magnetometer.
- ? Fluxgate three component vector magnetometer.
- ? RMS Aeromagnetic Automatic Digital Compensator (AADC II).
- ? Diurnal monitoring magnetometer (Scintrex Envimag).

Radiometric Data Acquisition Equipment

- ? Exploranium GR-820 gamma ray spectrometer.
- ? Exploranium gamma ray detectors.
- ? Barometric altimeter (height and pressure measurements).
- ? Temperature and humidity sensor.

3.1 Survey Aircraft

The aircraft used was a FU24-954 fixed wing survey aircraft owned by UTS Geophysics, registration VH-CYU.

Power Plant

? Engine Type	Single engine, Lycoming, IO-720
? Brake Horse Power	400 bhp
? Fuel Type	AV-GAS

Performance

? Cruise speed	105 Kn
? Survey speed	100 Kn
? Stall speed	45 Kn
? Range	970 Km
? Endurance (no reserves)	5 hours
? Fuel tank capacity	490 litres

3.2 Data Positioning and Flight Navigation

Survey data positioning and flight line navigation was derived using real-time differential GPS (Global Positioning System).

Navigation was provided through a UTS designed and built electronic pilot navigation system providing computer controlled digital navigation instrumentation mounted in the cockpit as well as an externally mounted track guidance system.

GPS derived positions were used to provide both aircraft navigation and survey data location information.

The GPS systems used for the survey were:

? Aircraft GPS Model	Novatel 3951R
? GPS satellite tracking channels	12 parallel
? Typical differentially corrected accuracy	2-3 metres (horizontal)
? Real-time differential service	RACAL Landstar

3.3 UTS Data Acquisition System and Digital Recording

All geophysical sensor data and positional information measured during the survey was recorded using a UTS developed, high speed, precision data acquisition system. Survey data was downloaded onto magnetic tape on completion of each survey flight.

Instrument synchronisation times were measured and removed in real-time by the UTS data acquisition system.

3.4 Altitude Readings

Accurate survey heights above the terrain were measured using a King radar altimeter installed in the aircraft. The height of each survey data point was measured by the radar altimeter and stored by the UTS data acquisition system.

? Radar altimeter model	King KRA-405, twin antenna altimeter
? Accuracy	0.3 metres
? Resolution	0.1 metres
? Range	0 - 500 metres
? Sample rate	0.1 Seconds (10Hz)

3.5 UTS Stinger Mounted Magnetometer System

The installation platform used for the acquisition of magnetic data was a tail mounted stinger. This proprietary stinger system was constructed of carbon fibre and designed for maximum rigidity and stability.

Both the total field magnetometer and three component vector magnetometer were located within the tail stinger.

3.6 Total Field Magnetometer

Total field magnetic data readings for the survey were made using a Scintrex Cesium Vapour CS-2 Magnetometer. This precision sensor has the following specifications:

? Model	Scintrex Cesium Vapour CS-2 Magnetometer
? Sample Rate	0.1 seconds (10Hz)
? Resolution	0.001nT
? Operating Range	15,000nT to 100,000nT
? Temperature Range	-20°C to +50°C

3.7 Aircraft Magnetic Compensation

At the start of the survey, the system was calibrated for reduction of magnetic heading error. The heading and manoeuvre effects of the aircraft on the magnetic data was removed using an RMS Automatic Airborne Digital Compensator (AADC II).

Calibration of the aircraft heading effects were measured by flying a series of pitch, roll and yaw manoeuvres at high altitude while monitoring changes in the three axis magnetometer and the effect on total field readings. A 26 term model of the aircraft magnetic noise covering permanent, induced and eddy current fields was determined. These coefficients were then applied to the data collected during the survey in real-time.

UTS static compensation techniques were also employed to reduce the initial magnetic effects of the aircraft upon the survey data.

3.8 Diurnal Monitoring Magnetometer

A base station magnetometer was located in a low gradient area beyond the region of influence by any man made interference to monitor diurnal variations during the survey.

The specifications for the magnetometer used are as follows:

? Model	Scintrex Envimag
? Resolution	0.1 nT
? Sample interval	10 seconds (0.1Hz)
? Operating range	20,000nT to 90,000nT
? Temperature	-20°C to +50°C

3.9 Barometric Altitude

An Air DB barometric altimeter was installed in the aircraft so as to record and monitor barometric height and pressure. The data was recorded at 0.33 second intervals and is used for the reduction of the radiometric data.

? Model	Air DB barometric altimeter
? Accuracy	2 metres
? Height resolution	0.1 metres
? Height range	0 - 3500 metres
? Maximum operating pressure:	1,300 mb
? Pressure resolution:	0.01 mb
? Sample rate	3 Hz

3.10 Temperature and Humidity

Temperature and humidity measurements were made during the survey at a sample rate of 10Hz. Ambient temperature was measured with a resolution of 0.1 degree Celsius and ambient humidity to a resolution of 0.1 percent.

3.11 Radiometric Data Acquisition

The gamma ray spectrometer used for the survey was capable of recording 256 channels and was self stabilising in order to minimise spectral drift. The detectors used contain thallium activated sodium iodide crystals.

Thorium, cesium and uranium source measurements were made each survey day to monitor system resolution and sensitivity. A calibration line was also flown at the start and end of each survey day to monitor ground moisture levels and system performance.

? Spectrometer model	Exploranium GR820
? Detector volume	33 litres

4 PERSONNEL

UTS Geophysics Perth Office Neil Goodey

5 SURVEY PARAMETERS

The survey data acquisition specifications for each area flown are specified in the following table:

PROJECT NAME	LINE SPACING	LINE DIRECTION	TIE LINE SPACING	TIE LINE DIRECTION	SENSOR HEIGHT	TOTAL LINE KM
Solitaire project 1	200m	000-180	2000m	090-270	25m	5,311
Solitaire project 2	200m	000-180	2000m	090-270	25m	461
TOTAL						5,772

The total number of line kilometres of survey data collected over the survey areas specified in the above table was 5,772.

The specified sensor height for the magnetic samples is as stated in the above table. This sensor height may be varied where topographic relief or laws pertaining to built up areas do not allow this altitude to be maintained, or where the safety of the aircraft and equipment is endangered.

The coordinate boundaries for the survey area flown is detailed in Appendix C.

6 SURVEY LOGISTICS

The base location used for operating the aircraft and performing in-field quality control and data processing of the survey data was the Granites Mine in the Northern Territory. The aircraft was operated from the Granites Mine Airstrip.

6.1 Survey Flight Summary

The following table summarises the flight logs for the survey area flown:

Flight Date	Area No	Flight No	Area Name / Survey Details	Lines Flown	Line Km Flown
13/09/99			Mobilisation to The Granites		
14/08/00	02	01	Solitaire 1 – Traverse Lines 200010-200100	10	33
	04	T1	Solitaire 2 – Tie Lines 400010-400050	5	30

	01	T1	Solitaire 1 – Tie Lines 100010-100290	29	476
23/08/00	02	12	Solitaire 1 – Reflys Lines - 200650-200680	4	
TOTAL					5,772

A complete survey kilometre report is contained in Appendix G of this report.

6.2 ***Diurnal Magnetometer Locations***

The following table contains the approximate locations where the diurnal base station magnetometer was located for each survey area.

Area Name	Period	Base Station ID	Location
Granites Mine	14/08/00-23/08/00	31	2km from the Granites Airstrip

6.3 ***Spectrometer Calibration Results***

Appendix E of this report contains the results of the daily spectrometer resolution and sensitivity tests performed during the survey.

7 DATA PROCESSING PROCEDURES

7.1 *Magnetic Data Processing*

The raw magnetic survey data was loaded from the field tapes and the recorded data trimmed to the correct survey boundary extents. Lines subsequently reflown were removed from the data. System parallax was removed from the raw data using corrections measured by the acquisition system.

The diurnal base station data was loaded, checked and suitably filtered for correction of the aircraft magnetic data. The filtered diurnal measurements were subtracted from the diurnal base field and the residual corrections applied to the survey data by synchronising the diurnal data time and the aircraft survey time.

The regional magnetic gradient was subtracted from the survey data by application of the IGRF model extrapolated to the date of the survey and interpolated on the survey position.

The data was then corrected to remove any residual parallax errors. Tie line levelling was applied to the parallax corrected data by measuring tie line crossover points with the survey traverse line data.

Final microlevelling techniques were then applied to the tie line leveled data to remove minor residual variations in profile intensities.

Located and gridded data were generated from the final processed magnetic data.

7.2 *Radiometric Data Processing*

The raw radiometric survey data was loaded from the field tapes and the recorded data trimmed to the correct survey boundary extents. Lines subsequently reflown were removed from the data. System parallax was removed from the raw data using corrections measured by the acquisition system.

Statistical noise reduction of the 256 channel data was performed using the Maximum Noise Fraction (MNF) method described by Dickson and Taylor (1998). This method constructs a noise covariance model from the survey data, which is then decorrelated and re-scaled so that the model has unit variance and no channel-to-channel correlation.

A principal component transformation of the noise-whitened data is performed, and the number of components to be saved is determined by ranking the eigenvectors by signal-to-noise ratio. The signal-rich components are retained, and the spectral data

reconstructed without the noise fraction. Typically, 32-42 MNF components are retained during this process.

Channels 30-250 only are noise-cleaned, as these contain the regions of interest and are not dominated by the lower end of the Compton continuum. The energy spectrum between the potassium and thorium peaks was recalibrated from the noise-cleaned 256 channel measurements.

The 256 channel data was then windowed to the 5 primary channels of total count, potassium, uranium, thorium and low-energy uranium. Dead time corrections were then applied to the data.

Cosmic and aircraft background corrections were applied. Radon background removal was performed using the Minty Spectral Ratio method (1992). Spectral stripping was then applied to the windowed data.

The radar altimeter data was corrected to standard temperature and pressure. Height corrections based on the STP radar altimeter were then performed to remove any altitude variation effects from the data (refer to Appendix E for stripping ratios and equations).

The corrected count rate data was then converted to ground concentrations for potassium, uranium and thorium. Final microlevelling of the total count, potassium, uranium and thorium data was then applied to remove minor residual variations in profile intensities.

For further information concerning the survey flown, please contact the following office:

GRIDDED DATASET FORMATS

Gridding was performed using a bicubic spline algorithm.

The following grid formats have been provided:

? ER-Mapper format

LINE NUMBER FORMATS

Line numbers are identified with a six digit composite line number and have the following format - ALLLLB, where:

A	Survey area number
LLLL	Survey line number 0001-8999 reserved for traverse lines 9001-9999 reserved for tie lines
B	Line attempt number, 0 is attempt 1, 1 is attempt 2 etc..

UTS FILE NAMING FORMATS

Located and gridded data provided by UTS Geophysics uses the following 8 character file naming convention to be compatible with PC DOS based systems.

File names have the following general format - JJJJAABB.EEE, where:

JJJJ	UTS Job number
AA	Area number if the survey is broken into blocks

APPENDIX B - COORDINATE SYSTEM DETAILS

Locations for the survey data are provided in both geographical latitude and longitude and Universal Transverse Mercator metric projection coordinate systems.

WGS84

Coordinate Type	World Geodetic System 1984
Semi Major Axis	Geographical
Flattening	6378137m
	1/298.257223563

AMG84

Coordinate Type	Australian Map Grid 1984
Geodetic datum	Universal Transverse Mercator Projection Grid
Semi Major Axis	Australian Geodetic Datum
Flattening	6378160m
	1/298.25

MGA94

Coordinate type	Map Grid of Australia 1994
Geodetic datum	Universal Transverse Mercator Projection Grid
Semi major axis	Geodetic Datum of Australia
Flattening	6378137m
	1/298.257222101

APPENDIX C - SURVEY BOUNDARY DETAILS

Job ID code: A3980101

Client: Gold Fields Australasia Pty Ltd

Job: Mt Solitaire Project 1

Coordinate System: AMG84 Grid Zone: 52

APPENDIX D - PROJECT DATA OVERVIEW

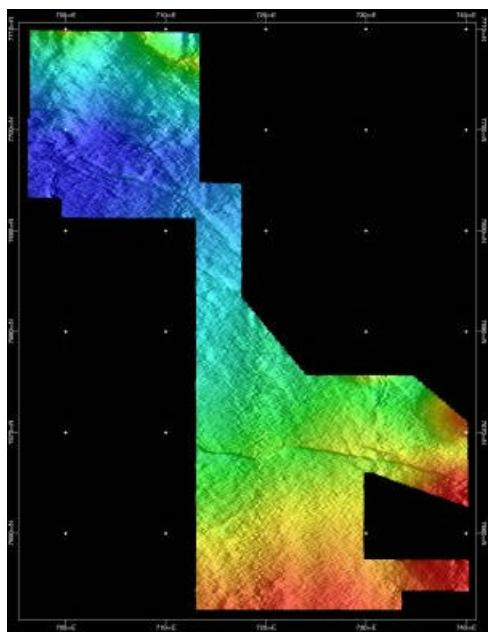

Mt Solitaire Project 1

Total Magnetic Intensity

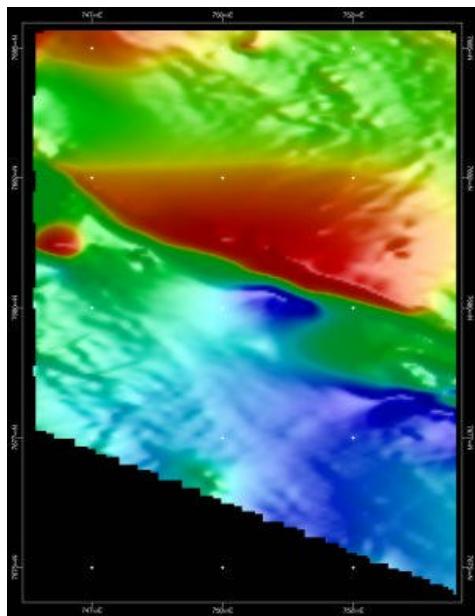

Radiometric Total Count

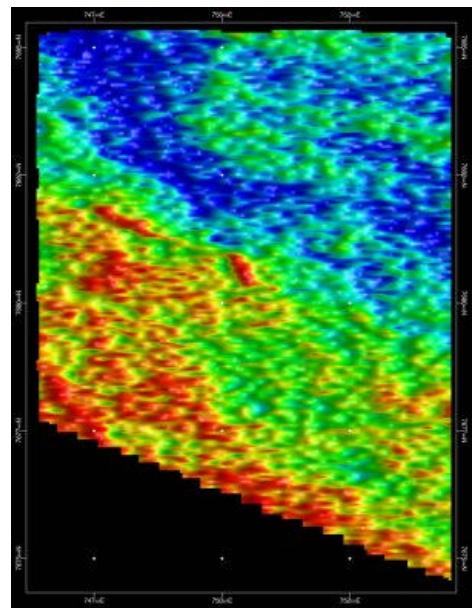

Digital Terrain Model

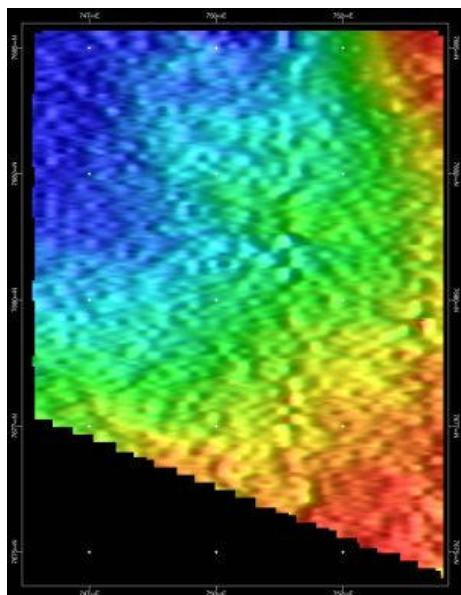

Mt Solitaire Project 2

Total Magnetic Intensity

Radiometric Total Count

Digital Terrain Model

APPENDIX E – RADIOMETRIC CALIBRATION RESULTS

APPENDIX F – DATA PROCESSING PARAMETERS

Magnetic Data

Mt. Solitaire Project 1

IGRF date	2000.71
IGRF mean value	51974 nT
Magnetic inclination	-52.617 deg
Magnetic declination	4.191 deg
Diurnal base value	51390 nT

Mt. Solitaire Project 1

IGRF date	2000.71
IGRF mean value	51937 nT
Magnetic inclination	-52.656 deg
Magnetic declination	4.264 deg
Diurnal base value	51390 nT

Radiometric Data

Stripping Ratios

?	0.224
?	0.395
?	0.722
a	0.047
b	0.000
c	0.000

Height Attenuation Coefficients

Total Count	-0.0060
Potassium	-0.0075
Uranium	-0.0039
Thorium	-0.0062

Final Reduction - All data reduced to STP height datum 25m

Stripping Equations

?	=	? + STPHeight * 0.00049
?	=	? + STPHeight * 0.00065
?	=	? + STPHeight * 0.00069
tho`	=	(tho - (a * ura)) / (1 - (a * ?))
ura`	=	(ura - (? * tho)) / 1 - (a * ?)
pot`	=	pot - (? * tho) - (? * ura`)

Conversion to Concentrations

$$\% \text{ K} = \text{k.cps} / 232.1$$

ppm U = u.cps / 33.0
ppm Th = th.cps / 9.2

APPENDIX G – SURVEY KILOMETRE REPORT
