1 ABSTRACT

This report describes the work conducted on EL 7146 during the period 9/11/91 to 8/11/92. For logistical reasons the exploration activities have been undertaken by Poseidon Gold, Tennant Creek Operations on behalf of Poseidon Exploration Ltd, Darwin.

During the report period a regional soil and stream sediment sampling programme designed to detect large stratiform base metal and gold accumulations was completed. At the time of writing a significant number of assay results have not been received and a detailed analysis of the results is not yet possible.

Future work will consist of assessment of the outstanding results to determine if any anomalous areas can be delineated. Areas so defined will be further investigated at a more detailed scale prior to vacuum, RAB or geophysical techniques being applied.
2

INTRODUCTION

2.1 Location and Access

Exploration Licence 7146, called Long Pound, lies approximately 100km east of Wauchope and southeast of Tennant Creek. Primary access is best via the Ali-Curung Aboriginal settlement and then via a limited number of tracks situated on Elkedra Station.

2.2 Climate and Physiography

The Davenport Range, like most of north-central Australia receives minimal rainfall during autumn, winter and spring and has a heavy wet season over the summer months. During the wet season, station tracks are often impassable and vehicular access is prohibited. The physiography of the area is extremely rugged with quartzite ridges over 40m in height separated by valleys overlying the finer sediment and basaltic units.

2.3 Tenure

Exploration licence 7146 was granted to Poseidon Exploration Ltd for a period of six years on the 9th of November, 1990. In April 1991, responsibility for the exploration and management of the tenement was passed to Poseidon Gold Limited’s Tennant Creek Operations. The licence which initially covered 1443 km² was reduced by 50% in October 1992. See Figure 1.

2.4 Previous Exploration

A review of the exploration reports held by the DME in Alice Springs showed that very little modern exploration has been conducted in the licence area. Minor exploration over parts of the licence has been undertaken for gold, tin-tungsten, diamonds and base metals.

Prior to the application for an exploration licence the Davenport province was identified as prospective for gold and base metals by an in-house Proterozoic study team. The interest in the area stems from the recognition of a similar structural setting to other basin-range provinces, well developed syn-depositional faulting and a lithological package including shallow to intermediated depth sediments and mixed phallic to mafic volcanics.

To determine whether the unit selected by the Proterozoic study were regionally anomalous and amenable to sampling a reconnaissance sampling programme was conducted by Poseidon Exploration staff. A total of 171 rock chip and 270, -180 mesh soil samples were collected on 23 geochemical traverses which varied in length from 2km to 17km. Rock chip samples were collected as outcrop permitted and soil samples were collected at 50m and 100m spacings on longer lines. Figure 2 shows the locations of the sample traverses.
The samples collected were assayed for Cu, Pb, Zn, Co, Ag, Au, W and Ba with numerous elevated responses for each element returned. The most interesting results came from ferruginous float samples and outcrop with more subtle responses returned for soil samples. Assay results for this work are located in appendix 1.

Following the grant of title a detailed 1:50,000 scale photo geological map and drainage base plan were prepared. The plans were prepared to facilitate the development of effective regional sampling strategies. This work indicated that soil sampling by foot was the only effective strategy given access and budgetary constraints.

The soil and stream sediment sampling programme conducted has to date proved unsuccessful in delineating any first class geochemical anomalism. The programme has, in an efficient and cost effective manner, tested the full strike length of the targeted lithologies. The sample programme proved successful in mapping the various lithologies and it is unlikely that any significant mineralisation occurs within the targeted area.

3. REGIONAL GEOLOGY

Geological mapping by the Bureau of Mineral Resources and the Northern Territory Geological Survey shows that the rocks in the tenement area are part of the Hatches Creek Group. Underlying the Hatches Creek Group lie metamorphosed and folded rocks of the Warramunga Group. Three sub-groups of the Hatches Creek Group have been mapped in the area.

The lower most Ooradidgee Sub-Group is represented in the northwestern portion of the tenement. The Sub-Group consists mainly of quartz-arenites interceded with thin conglomeratic units and shale beds. The volcanics mapped in the tenement consist of phallic tuff and lavas. The basaltic Edmirringee volcanic unit has not been located in the area.

The intermediate Wauchope Sub-group is well represented in the tenement and is comprised of lithic and quartz arenites, phallic and basic volcanics commonly with dolomitic and cherty with conglomerate intercalations. The uppermost Hanlon Sub-Group represents a broadly upward-fining sequence of sandstones followed by shales, siltstones and minor mudstones. The total stratigraphic thickness of the Hatches Creek Group is approximately 10,000m.
Structurally, the tenement area is reasonably complex with several broad and tight synforms and antiforms. These have been extensively faulted with the prominent fault directions being north-easterly and north-westerly. Displacements of several kilometres can be seen along major faults.

5. **EXPLORATION CONDUCTED NOVEMBER 1991 TO NOVEMBER 1992**

The reconnaissance sampling traverses gave sufficient encouragement for a regional soil sampling programme to be conducted. This programme was focused at the Alinjabon Sandstone, Frew River formation and the Kadinga Basalt which were identified by the Proterozoic study as being the most prospective.

5.1 **REGIONAL SOIL AND STREAM SAMPLING**

To adequately test the targeted lithologies for large mineralised bodies a programmes of soil samples and stream sediment sampling were conducted. In all, 1105 minus 180 micron soil samples from 270 line kilometres of traversing were collected. The samples were collected from blocks of traverses with a line spacing of 500m and sample interval of 250m. Blocks of lines were separated by 1.5 to 3 km. The programme covered approximately 70km of strike of the target lithologies. The samples were assayed for Au, Cu, Ag, Pb, Zn, Ni, Fe, Mn, As, Co and Cd and the results are displayed on plans 0265/GC/001 to 0265/GC/011. The tabulated results are shown in appendix 2.

150 stream sites were sampled with a -2mm x 5kg BLEG sample and a -1mm +300 micron sample being collected. The sampling covered the northern and eastern portions of the tenement at an approximate density of one site per 3km². Seven sites within the Mia Mia dome volcanic sequence were also sampled. Assay results for all stream sediment samples are awaited and will be included in the next annual report.

The results of the soil sampling were generally disappointing with only one area, designated anomaly A standing out as worthy of follow-up. The remaining results are all considered to be typical for the lithology they overlay with the majority of the variance detected being attributed to the mafic Kadinga Basalt. A more rigorous statistical treatment of the data will be applied once results from the stream sediment and follow-up soil samples are available.

5.2 **FOLLOW UP SOIL SAMPLING PROGRAMME**

A programme of closer spaced soil and rock chip traverses was conducted over the Anomaly 1 area (Plan No 15). A total of 168 soil samples were collected from 8 traverses with 250m between lines and 100m spaced samples. Of these 4 traverse lines were initially assayed to test the original anomaly. The maximum Au results from these traverses were 4 samples of 2 ppb Au. It appears from this test that there had been a batch error from the assay laboratory and therefore the remaining 4 traverse lines were not assayed.
Reconnaissance soil and rock chip sampling of the Mia Mia phallic volcanics encountered rock chip samples of 1.8% Ba and 22ppb Au in quartz veined and ferruginised phallic volcanics. A total of 109 soil samples and 10 rock chip samples were collected over 28.5km of traverses. Five traverses, all with 250m between soil samples were completed. Four of the traverses were 1km spaced and the fifth traverse covered the eastern portion of the Mia Mia dome where a outcrop of granite had been mapped. Results are pending and will be included in the next Annual Report.

6. **EXPENDITURE 9/11/91 TO 8/11/92**

7. **FUTURE WORK PROGRAMME**

The future work programme for EL 7146 is heavily dependant upon the results of the outstanding geochemical samples. Should the results prove disappointing no additional work is likely. If results prove more encouraging additional soil sampling, vacuum or RAB drilling and geophysical surveys will be employed to define targets worthy of RC or diamond drill testing. To conduct this work a provisional expenditure of $42,000 is proposed.

8. **PROPOSED EXPENDITURE 9/11/91 TO 8/11/92**

A provisional expenditure of $42,000 has been proposed to enable the follow-up geochemical sampling of areas delineated in the regional sampling programme.
