CRA EXPLORATION PTY LTD

ANNUAL REPORT
ROGERS KNOLL EL 2334
FOR THE YEAR ENDING 24.1.82

submitted by: G.P. JENKE .....

accepted by: W.H. Johnston .....

copy to : Dept of Mines & Energy N.T.

date: January 1982

Report No. 1075

CONTENTS

1. SUMMARY

Following the delineation of a discrete magnetic response by aeromagnetic surveys, ground magnetic and gravity surveys have been carried out over the source.

2. CONCLUSIONS

From an interpretation of the magnetic data, the source of the response comprises two bodies. The southern one is at a depth of 200 m at its south end and deepens towards the north. Dips remain steep towards the east along its length.

There has yet been no interpretation for the northern source.

3. INTRODUCTION

The magnetic response of interest within the EL was first noted (as an isolated feature on the northern edge of the Daly River Basin) during a detailed low level airborne magnetic and radiometric survey (Jenke, 1981). In the

surrounding areas the magnetic field is uniform or shows only gentle gradients from deep sources, where-as the above response is indicative of relatively shallow magnetic material.

The published geological maps show the immediate area covered by Quaternary alluvium with nearby outcrops of the Middle Cambrian Tindall Limestone and the Lower Cretaceous Mullaman Beds (sandstones, siltstones, grits and conglomerate), which are flat lying or dip very gently to the south. Antrim Plateau Volcanics may underlie the Tindall Limestone.

The regional BMR aeromagnetic contour map shows the response in a quiet area (Figure 1). Larger amplitude features occur to the NW along the edge of the basin and it is possible that all these sources are related. However, no outcrop likely to represent the sources has been mapped.

The exploration programme on the EL was designed to determine the physical parameters of the source with a view towards investigation by drilling.

5. TITLE

An application for an exploration licence over the area was lodged on 26.10.79. This was amended to an area of 30.89 square miles (80.00 km^2) in August 1980 and subsequently granted on 24.1.81 (Plan No.NTd 1491).

6. ABORIGINAL SACRED SITES

The Aboriginal Sacred Sites Protection Authority advised on 4.2.81 that there were no recorded sacred sites within the EL area.

7. AEROMAGNETIC SURVEY

The response was covered by an airborne magnetic and radiometric survey with a flight line spacing of 300 m and a mean terrain clearance of 80 m. The stacked magnetic profiles and flight path plot for the area are shown as Plan Nos. NTd 1305 and NTd 1276.

To define the response in more detail, a small contour map was compiled by hand (Appendix 1) to show a N-S striking feature about 2 km long separated from an equidimensional one to the north. Only one traverse, tie line 15E, crossed the response perpendicular to its strike. The response has been modelled by a two dimensional dyke to produce a depth of 250 m below the aircraft (170 m below ground level) and, assuming induced magnetization only, a dip steep to the east (Appendix 1). However, these results are approximate at best as the two dimensional model is a poor approximation to the source in this case.

8. GRIDDING

A point nominated as 5000 mE 5000 mN was chosen in the vicinity of the response defined by the airborne survey, identified on the flight path recovery photographs, and by reference to the flight path plans, was found to have an approximate AMG position of 246 760 mE 8 381 700 mN. From here, baselines were laid out as follows:-

5000 mN	4700 mE - 5000 mE
4700 mE	5000 mN - 6800 mN
5000 mE	2400 mN - 5000 mN

The initial bearings of these segments were established by

compass and then maintained by backsighting. Distances were chained, and flagged, permatagged wooden pegs positioned every 50 m.

Traverse lines were established with a topofil distance measuring device and compass. Stations were flagged at 50 m intervals and permatagged wooden pegs positioned 200 and 400 m either side of the 4700 mE and 5000 mE baselines.

9. GROUND MAGNETOMETER SURVEY

A digital base station magnetometer was positioned near 5000 mE 5000 mN and run throughout the survey with a reading interval of 30 s. This station was assigned a value of 47 700 nT, and the deviation from this was subtracted from the traverse line readings taken at the same time to remove the effect of diurnal changes.

Readings were taken at intervals of 5 m along traverse lines using Scintrex MP-2 magnetometers with a sensor elevation of 3 m. Profiles of the data (Appendix 2) show large erratic variations caused by shallow highly magnetic material, presumably laterite, such that only by manual smoothing of these profiles was it possible to define the response of the deeper source and compile a contour map (Plan No.NTd 1714).

10. GROUND MAGNETOMETER SURVEY INTERPRETATION

For the interpretation of the ground magnetic data, a two dimensional dyke model was used. As can be seen from the contour map (Plan No.NTd 1714) the strike extent of the

source is limited, so that this model can only roughly approximate it. All of the following work has assumed that remanent magnetization is not present.

On 3200 mN the best trial and error fit was for a 200 m wide dyke at a depth of 200 m and dipping 85°E. For the same dip, both the depth and width were varied but in each case, the fit was not as good. These and model results for other lines are included in Appendix 3.

In general, the steep easterly dip is maintained along the strike of the southern source and its depth increases northwards from about 200 m on 3000 mN to 350 m on 4 400 mN. At these depths it is not possible to accurately resolve the source thickness.

No interpretation has yet been carried out on the northern source.

11. GRAVITY SURVEY

The first phase of the gravity survey covered lines 2600 mN to 4000 mN using Lacoste and Romberg Meter (S/N G-544) in June 1981. Levels with distributed misclosures were established with respect to a datum at 5000 mE 3000 mN, and meter drifts were corrected by repeat measurements every 100 minutes or less. Four ties were made to the BMR station 9793.9318 at the old Katherine airport, but here only extrapolated drift rates were used for corrections. A meter constant of 1.01957 which was supplied with the instrument was used to convert the dial readings to milligals, and although this was later

measured as 1.02176 on the Adelaide calibration range, the difference was so small (0.2%) that the data was not recalculated except for the tie to the BMR station.

All levels were tied to a Department of Transport and Works benchmark (BM00:195.82 m) immediately south of the intersection of the Stuart Highway and the new Mainora Road by a traverse of about 3.35 km from 5000 mE 3000 mN. Level misclosures within the grid area did not exceed 0.07 m, and were not distributed.

From the BMR gravity station 6793.9318, a value of 978 326.71 mgals was established at 5000 mN 3000 mE, and in the tabulation of observed gravity values (Appendix 5) a value of 26.71 mgals has been adopted for that station. Profiles of the corrected gravity data are shown in Appendix 4. A Bouguer density of 2.2 tm^{-3} was used in the data reduction.

No contour map has yet been compiled, nor has any interpretation been carried out.

APPENDIX V

TABULATION OF GRAVITY MEASUREMENTS

METER S/N G-544

Lines 2600 mN - 4000 mN

Meter constant 1.01957

METER S/N G-326

Lines 4200 mN - 6400 mN

Meter constant 1.05848

Bouguer Density 2.2 tm^{-3}

Elevation Correction 0.2165 mgals m^{-1}

Latitude Correction 3.96074 x 10^{-4} mgals m^{-1} N-S

Latitude Correction Reference 5000 mE 5000 mN

Grid North is Magnetic North (4° east of True North)

From BMR station 6793.9318, the value of the observed gravity at 5000 mE 3000 mN has been established as 978 326.71 mgals.

ROGERS KNOLL EL2334 2600 mN 4200 mE - 5800 mE

I	mE	mN	Elevation (metres)	Observed gravity (msals)	Bouguer gravity (msals)
1	4200	2600	180.638	25.10	63.24

NOTES

5000 mE is approx AMG 246 760 mE
5000 mN 8381 700 mN
A base station adjacent to 5000 mE 5000 mN was assigned a value of 47700 nT
A constant of 47000 has been removed from the contour values shown
The contours were drawn from hand-smoothed profiles
The magnetometer sensor height was 3m and the station spacing was 5m
