MINERAL CLAIM NUMBERS 1197-1216
FORT DARWIN CAMP

N.H. SCRIVEN
JULY 1991
GEOLOGY

The northerly trending Margaret Syncline is the dominant structural feature covered by the mcn's. The synclinal core is Burrell Creek Formation and the remainder Mt. Bonnie Formation. Port Darwin Camp is located within the mcn's as a gold prospect. However nothing is known of the prospect as literature research failed to reveal any information and no ground surveys were done. A study of the magnetic contours covering the mcn's did not reveal any distinctive magnetic anomalies. Figure 1 gives the approximate position of the mcn's to the regional geology and fig.2, the magnetic contours.
