1.0 SUMMARY

The Curtis Pound Project covers Proterozoic rocks of the Tennant Inlier and contains a number of identified radiometric anomalies. A review of the geological data and previous exploration reports was undertaken during the first year of the lease, reconnaissance ground exploration work was carried out to check access. Systematic locating and checking of prospects from open file data commenced during Year 2 exploration and a total of 20 samples were collected returning insignificant results. Assay results for a further 4 rock chip samples collected in July 2008 are not available at the time of writing this report.

2.0 INTRODUCTION

Hale Energy Limited acquired the Curtis Pound Exploration License 24823 on the 2nd August 2006. The tenement has an area of 729.3km\(^2\) and an expiry date of 1 August 2012, with an annual exploration commitment of $42,000.

2.1 Location and Access

Hale Energy Limited’s Exploration License 24823 is located in the central part of the Northern Territory. Hale Energy Limited is a wholly owned subsidiary of Thor Mining PLC. The tenement is located approximately 340km north-northeast of Alice Springs and 125km south-southwest of Tennant Creek via the Stuart Highway and the Kurundi Station Track on the Bonney Well 1:250,000 SF53-02 map sheet (Figure 1). It covers over 700km\(^2\) of Proterozoic sediments that Hale Energy intends to explore for sandstone hosted uranium deposits. The prospective areas within the tenement are topographically steep and are covered by semi arid vegetation. Access is very limited and tracks would have to be established for any significant exploration activity.
2.2 Native Title and Site Clearance

There are three known recorded historical sites in the tenement; there are some non-registered Aboriginal sacred sites in the surrounding area. However, no mining or exploration activity will affect them. The Central Land Council has conducted a site clearance over the proposed areas and has placed an exclusion zone outside of the area of exploration activity.

3.0 GEOLOGY

The project area is over Paleoproterozoic rocks of the Tennant Creek Inlier. The rocks are comprised of two sedimentary and volcanic sequences (see Figure 2).
The upper sequence, of Hatches Creek Group rocks, covers most of the project area, within which the sequence is folded into three synclines and two intervening anticlines along northwest axes. The southwest syncline has moderate dips and forms the Curtis Pound. The tightly folded and faulted out Alexandra Syncline trends north-northwest in the central portion of the tenement, and the steeply folded Bonney Syncline is in the northeast of the area. The sequence, from top to bottom, is shale and siltstone, sandstone, basalt, siltstone with minor carbonate sediments, and a major sandstone unit.

The Hatches Creek Group unconformably overlies the Warramunga Group, which outcrops in the Skinner Anticline in the southeast of the project area, where it is comprised of a sandstone unit overlying basic volcanic rocks.

4.0 EXPLORATION & MINING

4.1 Previous Exploration

The region was explored for uranium by Pechiney (Australia) Exploration Pty Ltd (“Pechiney”) in 1971 and 1972. Pechiney flew an airborne radiometric survey over the region. It located nine radiometric anomalies within the Curtis Pound tenement area and followed up two of them. One, in a siltstone unit, was found to be caused by thorium.
The other, near the axis of the Curtis Syncline, was traced to a 90m long and 1m thick bed consisting largely of microcrystalline apatite. A grab sample of the rock contained 320ppm U\textsubscript{3}O\textsubscript{8}.

4.2 Current Exploration

A review of the geological data and previous exploration reports was undertaken during the first two years of the lease, no exploration work was carried out other than field reconnaissance. A list of the open file reports reviewed is displayed in Appendix 1.

Compilation and review of all available open file data for Curtis Pound has highlighted the following prospects that need confirmation and assessment by reconnaissance field sampling:

- 1.13ppm Au from rock chip (CR19960197)
- 138ppm Ag, 6.7% Pb, 12ppm Zn, 7.65% Cu from map58/6 block 43/21 (CR19950149)
- Uranium prospect with 270ppm U in a lenticular bed of phosphatic rock running parallel to bedding. (CR19720037)
- North of tenement reported to have small specimen gold after prospecting with metal detectors (CR19970216)
- Edmirringee Volcanics in the north and east of tenement and host gold and copper prospects and mines in the area

A short reconnaissance field trip was undertaken with a focus on locating a previously documented uranium anomaly from open file data. This anomaly was not able to be located. Assay results for the 20 samples collected in February 2008 (see Appendix 2) on this field trip were generally poor and not worthy of following up, however further investigation into the location of the uranium anomaly is recommended.

A subsequent field trip to investigate the uranium anomaly was conducted in July 2008. The anomaly was located and 4 samples were taken but due to long turn around times assays are not available at the time of writing this report.

4.2 Exploration Potential

Limited exploration has been carried out over the tenement area for uranium mineralisation mainly due to difficult access. A number of anomalies have been identified, but are not known to have been followed-up and location of them to date has proved extremely difficult. Systematic reconnaissance exploration over the area will help confirm the location of both the previous anomalies and generate new prospects including any gold and base metal potential.
4.3 Proposed Exploration

Hale Energy Limited will continue to carry out reconnaissance geological and geophysical anomaly follow-up in an attempt to locate previously identified prospects. Initial investigations have indicated that some locations are over a kilometre out. The proposed second stage exploration will comprise systematic drill testing of targets delineated during initial exploration once access for vehicles has been constructed.

5.0 EXPENDITURE

See the attached expenditure form.
