PARTIAL RELINQUISHMENT REPORT
EL23391

FOR THE YEAR ENDED
2nd September 2008

Prepared by:
Catherine Turnbull – Geologist
On behalf of Proto Resources & Investments Ltd

Distribution:
Proto Resources & Investments Ltd – Sydney
NT Dept Minerals & Energy - Darwin
1 INTRODUCTION

The Arunta Project is located approximately 250km NNW of Alice Springs in the Northern Territory. The North Arunta Province is dominated by a series of sulphidic Palaeoproterozoic sedimentary sequences intruded by granite plutons and mafic sills. Quaternary and Tertiary cover conceals large areas of bedrock in the area however the region has seen exploration for a variety of commodities including gold, base metals, iron ore, uranium and diamonds.

Work by Proto Resources & Investments Ltd on EL23391 has highlighted the prospectivity of 6 priority GEOTEM targets within the licence area. As such, it is recommended that Proto execute a 50% reduction relinquishing those sub-blocks outside of the area of interest.

2 PROPERTY DESCRIPTION AND TENURE

EL23391 of 63 sub-blocks was originally granted to Falconbridge on 3 September 2003 for a period of six years. However, 100% ownership was transferred to Discovery Nickel Limited pursuant to a Heads of Agreement dated 15 October 2003, and subsequently Proto Resources & Investments Ltd on the 29 October 2006.

3 ACCESSIBILITY AND INFRASTRUCTURE

The tenement is located approximately 235km NNW of Alice Springs in the Northern Territory and covers portions of the Mt Peake (SF53-05), 1:250,000 map sheet. It lies within the Stirling and/or Anningie Perpetual Pastoral Leases and is subject to Native Title. Access to the area is facilitated by the Central Land Council (CLC) through an Exploration Deed Accessibility and Infrastructure.

The project area can be accessed via the all weather Alice Springs-Darwin highway. Additional roads extend up to 100km west of the highway through the project area and are accessible by four wheel drive vehicles (Figure 1).
4 GEOLOGICAL SETTING

The project area lies within the north-central portion of the Paleoproterozoic Arunta Province. The stratigraphy of the Arunta province comprises relics of 2500 Ma Archaean basement overlain by >1800 Ma Palaeoproterozoic, turbiditic sequences of greywacke, quartz, sandstone, siltstone and shale along with mafic rocks and their high-grade metamorphic equivalents. The Arunta also has minor calc-silicates and meta-felsic volcanic units. During the Barramundi Orogeny, the sedimentary units were intruded by mafic rocks which have been deformed and in places metamorphosed to amphibolite facies. During the closing stages of the Barramundi Orogeny (~1830 Ma) granite plutons intruded rocks of the Arunta Province. The main divisions of these Palaeoproterozoic basement rocks (youngest at top) are:

Reynolds Range Group (gneiss, amphibolite, quartzite and calc-silicate)
Lower Hatches Creek Group (sandstone)
Strangeways Range Metamorphics (mafic and felsic granulite, quartzite, calc-silicate)
Atnarpa Igneous Complex (schist, gneiss, amphibolite, quartzite, calc-silicate)
Killi Killi Formation (Atnarpa and Lander Rock beds)

These basement rocks are intruded by granite and gneissic granite and gabbro and dolerite. The Arunta Palaeoproterozoic basement rocks are associated with folding, faulting, igneous intrusion and unconformities which may have generated several suitable host sites for uranium and base metal mineralisation. Regional aeromagnetic surveys conducted over the Arunta Province highlight the numerous “rafts” of mafic rocks included within the metamorphic and igneous complex of the Atnarpa Group. These are thought to be remnants of intruded sills or possibly portions of Archaean basement rocks and are ideal sites for the deposition of mineralised fluids released during the prolonged periods of orogenic activity. The Proto project area is host to several such bodies.

At the project level, rocks of the Palaeoproterozoic Lower Hatches Group, Reynolds Range Group, undifferentiated granitoid and gabbro-dolerite association occur. Neoproterozoic to Palaeozoic rocks of the Georgina Basin cover the Palaeoprotoezoic rocks in the south to southeast. In places, Quaternary and Tertiary cover sequences of variable depth (range from a few meters to in excess of 100m) conceal the basement rocks.
Figure 1 Location Map
5 PREVIOUS EXPLORATION

The Arunta Province has been explored for gold, uranium, rare earths and base metals by various companies. The province is considered prospective for a number of base metal mineralisation styles from Proterozoic stratabound Cu-Pb-Zn to skarn-related Cu-Au and Pb-Zn-Cu and acid volcanic Cu-Pb-Zn. The province hosts a number of significant base metals deposits including; Jervois 6.1Mt @ 2.1% Cu, Prospect D 3.2Mt @ 0.6% Cu & 0.2% Ni, Oonagalabi 25Mt @ 0.5% Cu & 1% Zn and Home of Bullion 0.13Mt @ 7.1% Cu, 5% Zn & 2% Pb.

The area also hosts a number of sub-economic occurrences of gold, tin, tungsten, tantalum, mica, nickel, chromite and semi-precious stones.

In terms of the exploration within EL23391, Discovery Nickel Ltd acquired GEOTEM data over the southern portion of the licence area which defined 16 conductive targets (Table 2) during 2004. In the time since Proto acquired the Arunta Project from Discovery in late 2006 they have commissioned a full review of the GEOTEM data by GeoDiscovery Group which has allowed the selection of 6 priority targets within the licence area. No ground work has as yet been completed on the licence.

Table 2. Previous Exploration Activities
6 EXPLORATION COMPLETED DURING THE REPORTING PERIOD.

Exploration completed during the current reporting period has been limited to further desk-top review of the selected conductive targets identified from the GEOTEM survey (Figure 3) and review of the ground holding with view to partial relinquishment of the licence area.

7 LAND ACCESS

A land access agreement is currently in place with the Traditional Owners that facilitates access to EL23391. The Deed was transferred to Proto Resources and Investments Limited on 29 October 2006 however access to the licence area has not been sought during the current reporting period.

8 PARTIAL RELINQUISHMENT

Proto has decided to relinquish 32 sub-blocks of EL23391 with the view to focus exploration activities on the 6 priority GEOTEM targets which are located in the portion of the licence to be retained (Figure 3).
