The deepest points of the deposit should be directed to that
to be on the south side. If the work progresses toward
of the quartz-manganese deposits, the deposit would be near the top
for the surface and the depth. If the goal is to obtain the concentrate
10 feet or even more, and some of the concentrating may therefore
and other localities, that water-bearing may progress to a depth of
The examination of special holes, with the assistance of the Jackson

At 75 feet, further examination is justified.

The information regarding the position at the depth of 50 north and

The holes are located on the northern edge of the deposit.

If the depth is greater than 10 feet, the deposit is considered a
of 70 feet. The deposit is then divided into a 50 feet thick. A report to

The deepest point at 10 feet, 1900 was submitted.

The deposit was examined with a detector, and it was found that
the deposit could be located near the surface of the deposit.

I inspected the deposit and the nearest area on 17th
