Annual Exploration Report – Year 2

Exploration Licence EL27237

30th March 2010 to 29th March 2011

Holder: North Australian Diamonds Limited
Reporting Period: 30th March 2010 to 29th March 2011
Sheet Reference: Mt Marumba (SD 53-06) 1:250,000
Due Date: 29th April 2011

Author: Tom Reddicliffe
Date: 29th April 2010
Report No: 11-020
Copies To: Dept. of Resources - NT
NADL Office

The contents of this Report remain the property of North Australian Diamonds Ltd. and may not be published in whole or in part, nor used in a company report without the written consent of the company.
SUMMARY

This report details diamond exploration activity carried out by North Australian Diamonds Limited (NADL) over Exploration Licence EL27237 for the period 20th January 2010 to 19th January 2011. This period represents Year 2 of the licence. The licence has been granted and is currently held by NADL.

The licence is located on the North Australian Craton within a region that has tectonic and structural similarities with known kimberlite occurrences including the Merlin Kimberlite Field and Abner Range discovery.
1.0 INTRODUCTION

This report details exploration activity carried out by North Australian Diamonds Limited (NADL) over Exploration Licence EL27237 for the period 20\textsuperscript{th} January 2010 to 19\textsuperscript{th} January 2011. This period represents Year 2 of the licence. The target for exploration within the licence is diamond bearing kimberlite intrusives.

2.0 LICENCE HISTORY

The licence EL27237 was first applied for by TEU and granted in 2009.

3.0 LICENCE DETAILS

EL27237 is located on the Mt Marumba (SD53-06) 1:250,000 and Annie Creek (5871) 1:100,000 map sheets. A location map is shown in Figure 1.

4.0 PHYSIOGRAPHY

4.1 Geomorphology

Two major physiographic subdivisions occur within the project area, the Arafura Fall, where the drainage system direction is towards the Arafura Sea and the Gulf Fall, where the drainage system direction is towards the Gulf of Carpentaria.

EL27237 is situated approximately 160m above sea level and contains an extensive drainage network suitable for traditional stream gravel sampling and bulk gravel sampling. A northeast-southwest oriented drainage divide occurs in the southeast portion of the licence and separates dissected hilly country of the Arafura Fall from similar terrain of the Gulf Fall. Alluvial floodplains occur in the central northern most part of the licence.
4.2  Geology

The licence is located within the North Australian Craton on the tectonically stable Arnhem Shelf, that part of the northwestern McArthur Basin characterised by comparatively mild deformation.

The oldest rocks in EL27237 are Mesoproterozoic age and include sandstones, quartzarenites and siltstones of the Roper Group. The sediments unconformably overly basement rocks, which do not crop out within the license area but are presumed to include the metasedimentary succession of the Pine Creek Geosyncline and associated igneous intrusives. Subvertical dolomite dykes of Proterozoic age are common and display two orientations: 000° and 045°.

The distribution of dykes is controlled by local and regional structures with many following shear zones and fracture sets.

A large part of the area is covered by Cainozoic soils comprised of residual soils of unknown thickness overlying bedrock.

4.3  Geophysics

Airborne regional data was acquired in the late 1980’s and early 1990’s during surveys contracted to the NTGS and include the ‘Milingimbi’, ‘Marumba’, and ‘Mitchell Range’ surveys. Magnetic and gamma-ray spectrometry datasets were collected along east-west flight lines spaced at 500m apart and flown at a height of 100m above the ground. Magnetic data clearly highlights prominent features such as faults and several mapped dolomite dykes that appear as bull’s-eye anomalies. Review of the regional datasets did not identify any targets for immediate follow-up.

In addition regional gravity surveys were conducted by Australian Geological Survey Organization (AGSO). The gravity measurements are at 11 km station spacing and therefore do not provide useful information for near surface geological interpretation.
5.0 PREVIOUS EXPLORATION

A review of the Northern Territory Geological Survey (NTGS) database indicates that no exploration activity had been completed on EL27237. The closest diamond exploration to either licence includes five stream gravel samples collected adjacent to the northern boundary of EL3336 by DBAE in 2001, which reported negative results for diamonds and indicator minerals. More intense diamond exploration has been undertaken within 50km of the licence with numerous chromites, microdiamonds and pyropes recovered from stream gravel samples collected by Normandy Mining Limited, Stockdale Prospecting Limited (DBAE subsidiary) and DBAE. These results provide encouragement and highlight the potential for a kimberlite source to exist in the region.

Work during the reporting period 2009-2010 comprised of 2 loam samples. The samples were submitted to the company’s wholly owned mineral processing laboratory in Perth. These samples returned a negative result.

6.0 EXPLORATION COMPLETED DURING CURRENT REPORTING PERIOD

Work completed during the current reporting period comprised of the collection of 1 stream gravel sample and after mineral processing at the company owned laboratory in Perth it has returned a negative result.

7.0 EXPLORATION EXPENDITURE

Exploration expenditure for the reporting period is summarised below and detailed on accompanying Expenditure Reporting forms submitted.

8.0 PROPOSED PROGRAMME AND BUDGET FOR 2011-2012

Subject to the results from the follow-up samples currently being analysed, further follow-up loam sampling will be undertaken within EL27237.
