On behalf of Mineral Titles
Apart from about one Kilometre of the Manganese reef that I found several years ago, I have had no further success within this block. I sampled, milled and panned several 7 Kg samples from narrow Quartz reefs and none of them showed any gold.

There are a few old diggings from the 1880's in the S.W. corner of the block, but I believe that this gold came from near the start of the Mn reef on the "Withnall Fault" on the block below and also perhaps from the heavily worked (1880's) "Fireplace Diggings" near the N.W. corner of our M.L 30125. Refer to the attached map.

I suggest that the block being surrendered should be included within the Public Fossicking Area. This might lead to detector operators finding new unexposed reefs.
