SUMMARY

MCNs 377, 378, 379 & 380 cover part of the Howley Anticline approximately 37 km southeast of Adelaide River. Northern Gold has held the claim areas since 1983, and has completed many individual phases of exploration since then. In 1983/84 geological mapping, costeanning and sampling, percussion drilling, RRMIP geophysical survey, ground magnetic survey and sediment sampling was completed. This program highlighted the prospectivity of the area with the best RC intersections of 3m @ 6.3 g/t in B6, 16m @ 1.5 g/t in B4, and 5m @ 2.5 g/t in C4.

In 1985/86 a further small drilling programme was conducted to test previous results. Generally low to moderate gold grades were returned and the programme failed to upgrade the previous results.

In 1987/88 a further programme of RC drilling and soil sampling was completed. Widespread anomalous gold was intersected, although individual holes returned mixed results.

In 1989/90 additional RC drilling was conducted. Several discontinuous pods of mineralisation, which vary in width from one to five meters were defined.

Following a re-evaluation of drilling in the 1989/90 field season, further resource drilling was completed in 1994 to test the northern and southern strike extensions of the Nugget resource, and to close off mineralisation to the east. A target corridor of mineralisation was identified following the hinge of the Howely Anticline north.

Infill drilling was completed to test known mineralised zones.

The program completed 60 RC holes for 3582 metres. Infill drilling suggests mineralisation may extend further north by approximately 200 metres although results from the most southern drill holes were disappointing. The 1994 program has also identified significant extensions to the mineralisation near the surface.

The widths and continuity of the mineralised intercepts and depth of the mineralisation in the area drilled warrant further resource studies.

INTRODUCTION

1.1 Titles

MCN 377, MCN 378, MCN 379 and MCN 380 were granted on 14th June 1983 for a period of 10 years and expired in June 1993. An application for renewal was lodged in 1994 and was granted, with expiry on the 31/12/98.

1.2 Location and Access

MCNs 377-380 are located approximately 40 km south of Adelaide River in the Pine Creek Geosyncline. The claims are known locally as the North Ridge prospect. The prospect is situated at the northern end of the Howley Line, which is a line of gold workings including Dominion Mining's Cosmopolitan Howley gold mine (Figure 1).

Access to the claims is via the Stuart Highway and the Metana Camp road.

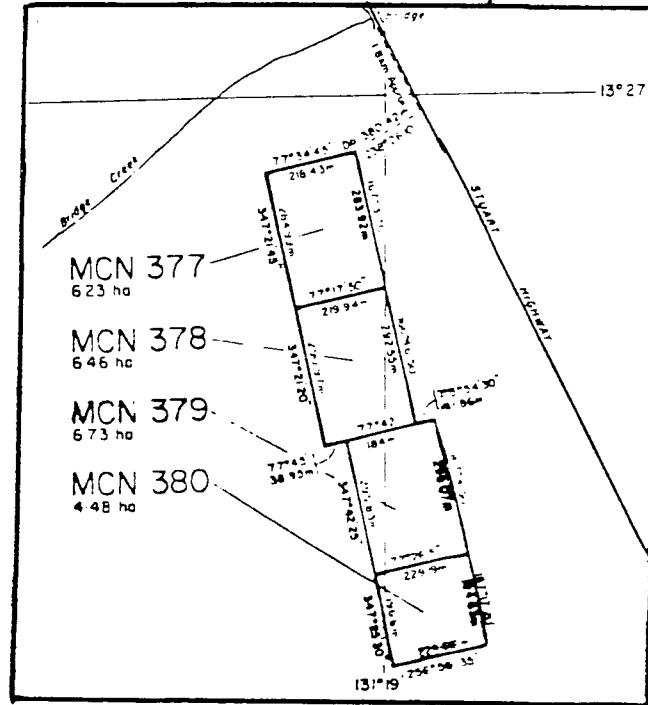

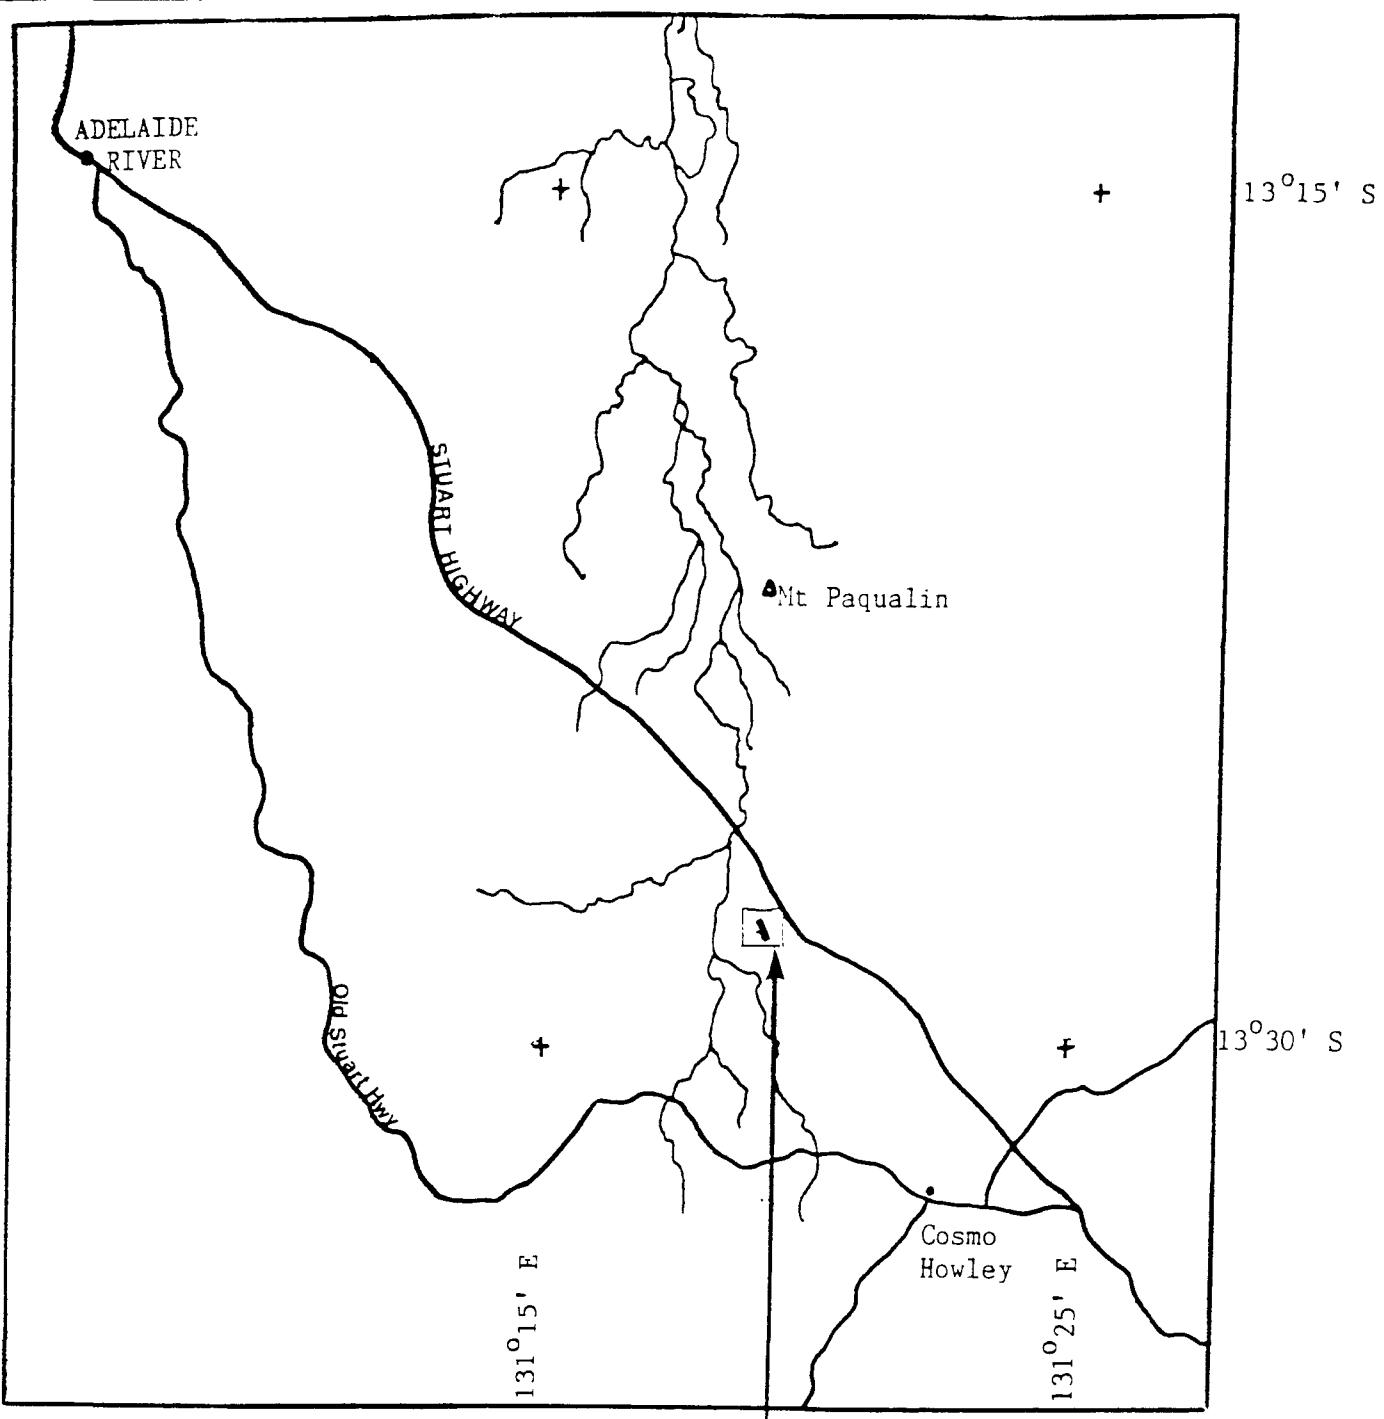

Figure 1. Location Plan

2 GEOLOGY

2.1 Regional Geology

The structural geology of the Howley area is dominated by two macroscopic structures, the Howley Anticline and a series of anastomosing brittle-ductile shear zones with associated quartz veining.

The Howley Anticline is a macroscopic fold structure, which has been identified from Cosmo Howley in the south to Mt. Paqualin in the North. Primary bedding (S_0) in the sedimentary units is the form surface to the fold. The fold is best described as a doubly plunging upright, asymmetric, tight, non-cylindrical fold which plunges to the north in the vicinity of the Cosmo Howley mine and plunges to the south in the Bridge Creek area.

An anastomosing series of north to northwest trending, sub-vertical, ductile-brittle shear zones deform the earlier fold structures. The shear zones strike north to northwest and dip 80° to the west and offset both S_0 and S_1 structures.

2.2 Local Geology

Outcrop on the claims consists of lithologies of the South Alligator Group, which have been tightly folded to form the Howley Anticline. These lithologies can be subdivided into two distinct groups, which have tentatively been assigned stratigraphic formation names.

The lithologies belonging to the Gerowie Tuff lie stratigraphically above the rocks of the Koolpin formation and occur in the northern part of the claims. The eastern limb of the anticline comprises a monotonous sequence of bedded cherts and mudstones. The western limb of the fold is defined by a series of bedded cherts, yellow claystones and mudstones. The lithologies on the western limb strike 335° and dip 65° to the west whereas the rocks forming the eastern limb strike 002° and dip from 80° to the west to vertical.

The rocks which comprise the Mt. Bonnie formation occupy the southern part of the area covered by the claims, and are stratigraphically above the cherts, which form the Gerowie Tuff. The first occurrence of the Mt. Bonnie formation is taken to be a coarse-grained greywacke, which forms a distinctive marker horizon along the eastern limb of the anticline. The main rock types consist of alternating mudstones,

greywackes and thin BIF horizons. The lithologies on the western limb strike 335° and dip 65° to the west whereas the rocks forming the eastern limb strike 002° and dip from 80° to the west to vertical.

2.3 MINERALISATION

Gold mineralisation along the Howely Ridge occurs in all lithological units, though best grades are associated with iron and carbonaceous rich sedimentary units and dolerite. The mineralisation is associated with tension fractures, stockwork zones and laminated quartz veins. Gold mineralisation has a heterogeneous distribution, and is confined to elongate zones associated with regional folds or shear zones. Recent mapping suggests that the dominant control on mineralisation is structural rather than dependent on rock type. The mineralisation generally occurs in quartz veins parallel to shear fabrics, in stockwork zones, where quartz veins occur as tension fractures which have been formed synchronously with shearing, and also parallel to either bedding or an axial planar cleavage or as disseminated gold within sheared alteration zones.

3 PREVIOUS EXPLORATION

In 1983/84 an intense programme of geological mapping, costeanning and sampling, percussion drilling, RRMIP geophysical survey, and sediment sampling was completed in conjunction with work on the Bridge Creek Prospect. Twenty RC holes (A1-4, B1-4, C1-4, D3, E3, F3, and G1-5) were drilled. This program highlighted the prospectivity of the area with better RC intersections of 3m @ 6.3 g/t in B6, 16m @ 1.5 g/t in B4, and 5m @ 2.5 g/t in C4.

Four costeans were excavated in the claim areas, The results did not reflect anomalous results in the RC drilling. A full presentation of results are contained in Richardson & Kater, 1984.

In 1985/86 a further RC drill hole was completed in the region of the previous drilling (BCP 86/8). The hole contained significant low-grade anomalous gold values, but results were considered too widespread to be encouraging. This hole is shown in detail in Bravo, 1986.

In 1987/88 soil sampling and drilling was conducted. A geochemical soil sampling programme over the claim areas was used as a pre-cursor to the drilling programme. Results of the programme show a high level gold anomaly over the anticlinal hinge zone of up to 295 ppb Au BLEG Au and 2.8 ppm Au from fire assay.

Sixteen RC holes (HR1-HR16) were drilled in the claim areas, and further drill pads constructed for extra proposed drilling. The drilling results were encouraging with best results of 3m @ 2.4 g/t in HR10 and 4m @ 2.16 g/t in HR12. Results of this programme are given in detail in Ronk, 1988.

In 1989/90/91, fifty-three RC holes were drilled on MCNs 377-380 for a total of 2878 metres (HR17-59). All these holes were drilled on an azimuth of 86° magnetic (grid east). Following promising results from HR22 and HR49, ten additional holes were drilled to depths of 20 to 35 metres for a total of 395 metres. These holes were spaced 10 metres apart and were drilled at 45°. Six holes were drilled on an azimuth of 86° magnetic and 4 holes on an azimuth of 266° magnetic.

Initial drilling identified several discontinuous pods of mineralisation with intersections varying in width from 1 metre to 5 metres with grades varying from 0.7 g/t to 200 g/t.

Duplicate samples sent to Analabs, and numbered NUG 0101 - NUG 1030, correlated well with those original samples analysed by AAL. However a small, but significant, number of samples returned spurious results suggesting coarse gold was present.

To test for coarse gold, as suggested by the duplicate assays, three high grade assay samples received from HR4923, HR4924 and HR2224 were manually panned in the field. All three samples produced a well defined gold tail and a total of 6 grams of gold nuggets were panned from approximately 7 kg of sample. This exercise confirmed the presence of coarse gold in the area, and also suggests that the assay technique significantly underestimated the gold content of some of the high grade samples.

The zone containing the high grade mineralisation appeared to be continuous along strike for at least 100 metres and open to the south with the highest grades concentrated at 18 metres true vertical depth.

The initial high grade intersections appear to be related to a quartz vein which is 6 metres wide and trends 350°. The vein dips 60° to the east at its northern end, but is vertical at its southern end. This variation in dip direction complicates the interpretation of the initial drilling. The high grade zone is 1-2 metres wide and is situated on the hanging wall side of the vein.

Samples were initially panned off on site however no visible gold was recorded from these later holes. Ten additional holes NUG01-NUG10 were drilled to test the extent of the high grade mineralisation. The assay results confirmed the extent of mineralisation but no high grade zones were reported. The drilling has discounted the continuity of the two high grade pods between drill lines. However the geometry, dimensions and grade of the high grade pods remains unclear.

A full discussion and presentation of results and methods is contained in Stokes & Partington, 1991.

4 EXPLORATION COMPLETED

Northern Gold NL completed a resource RC drill program, following a re-evaluation of data obtained from all previous drilling.

4.1 Drilling

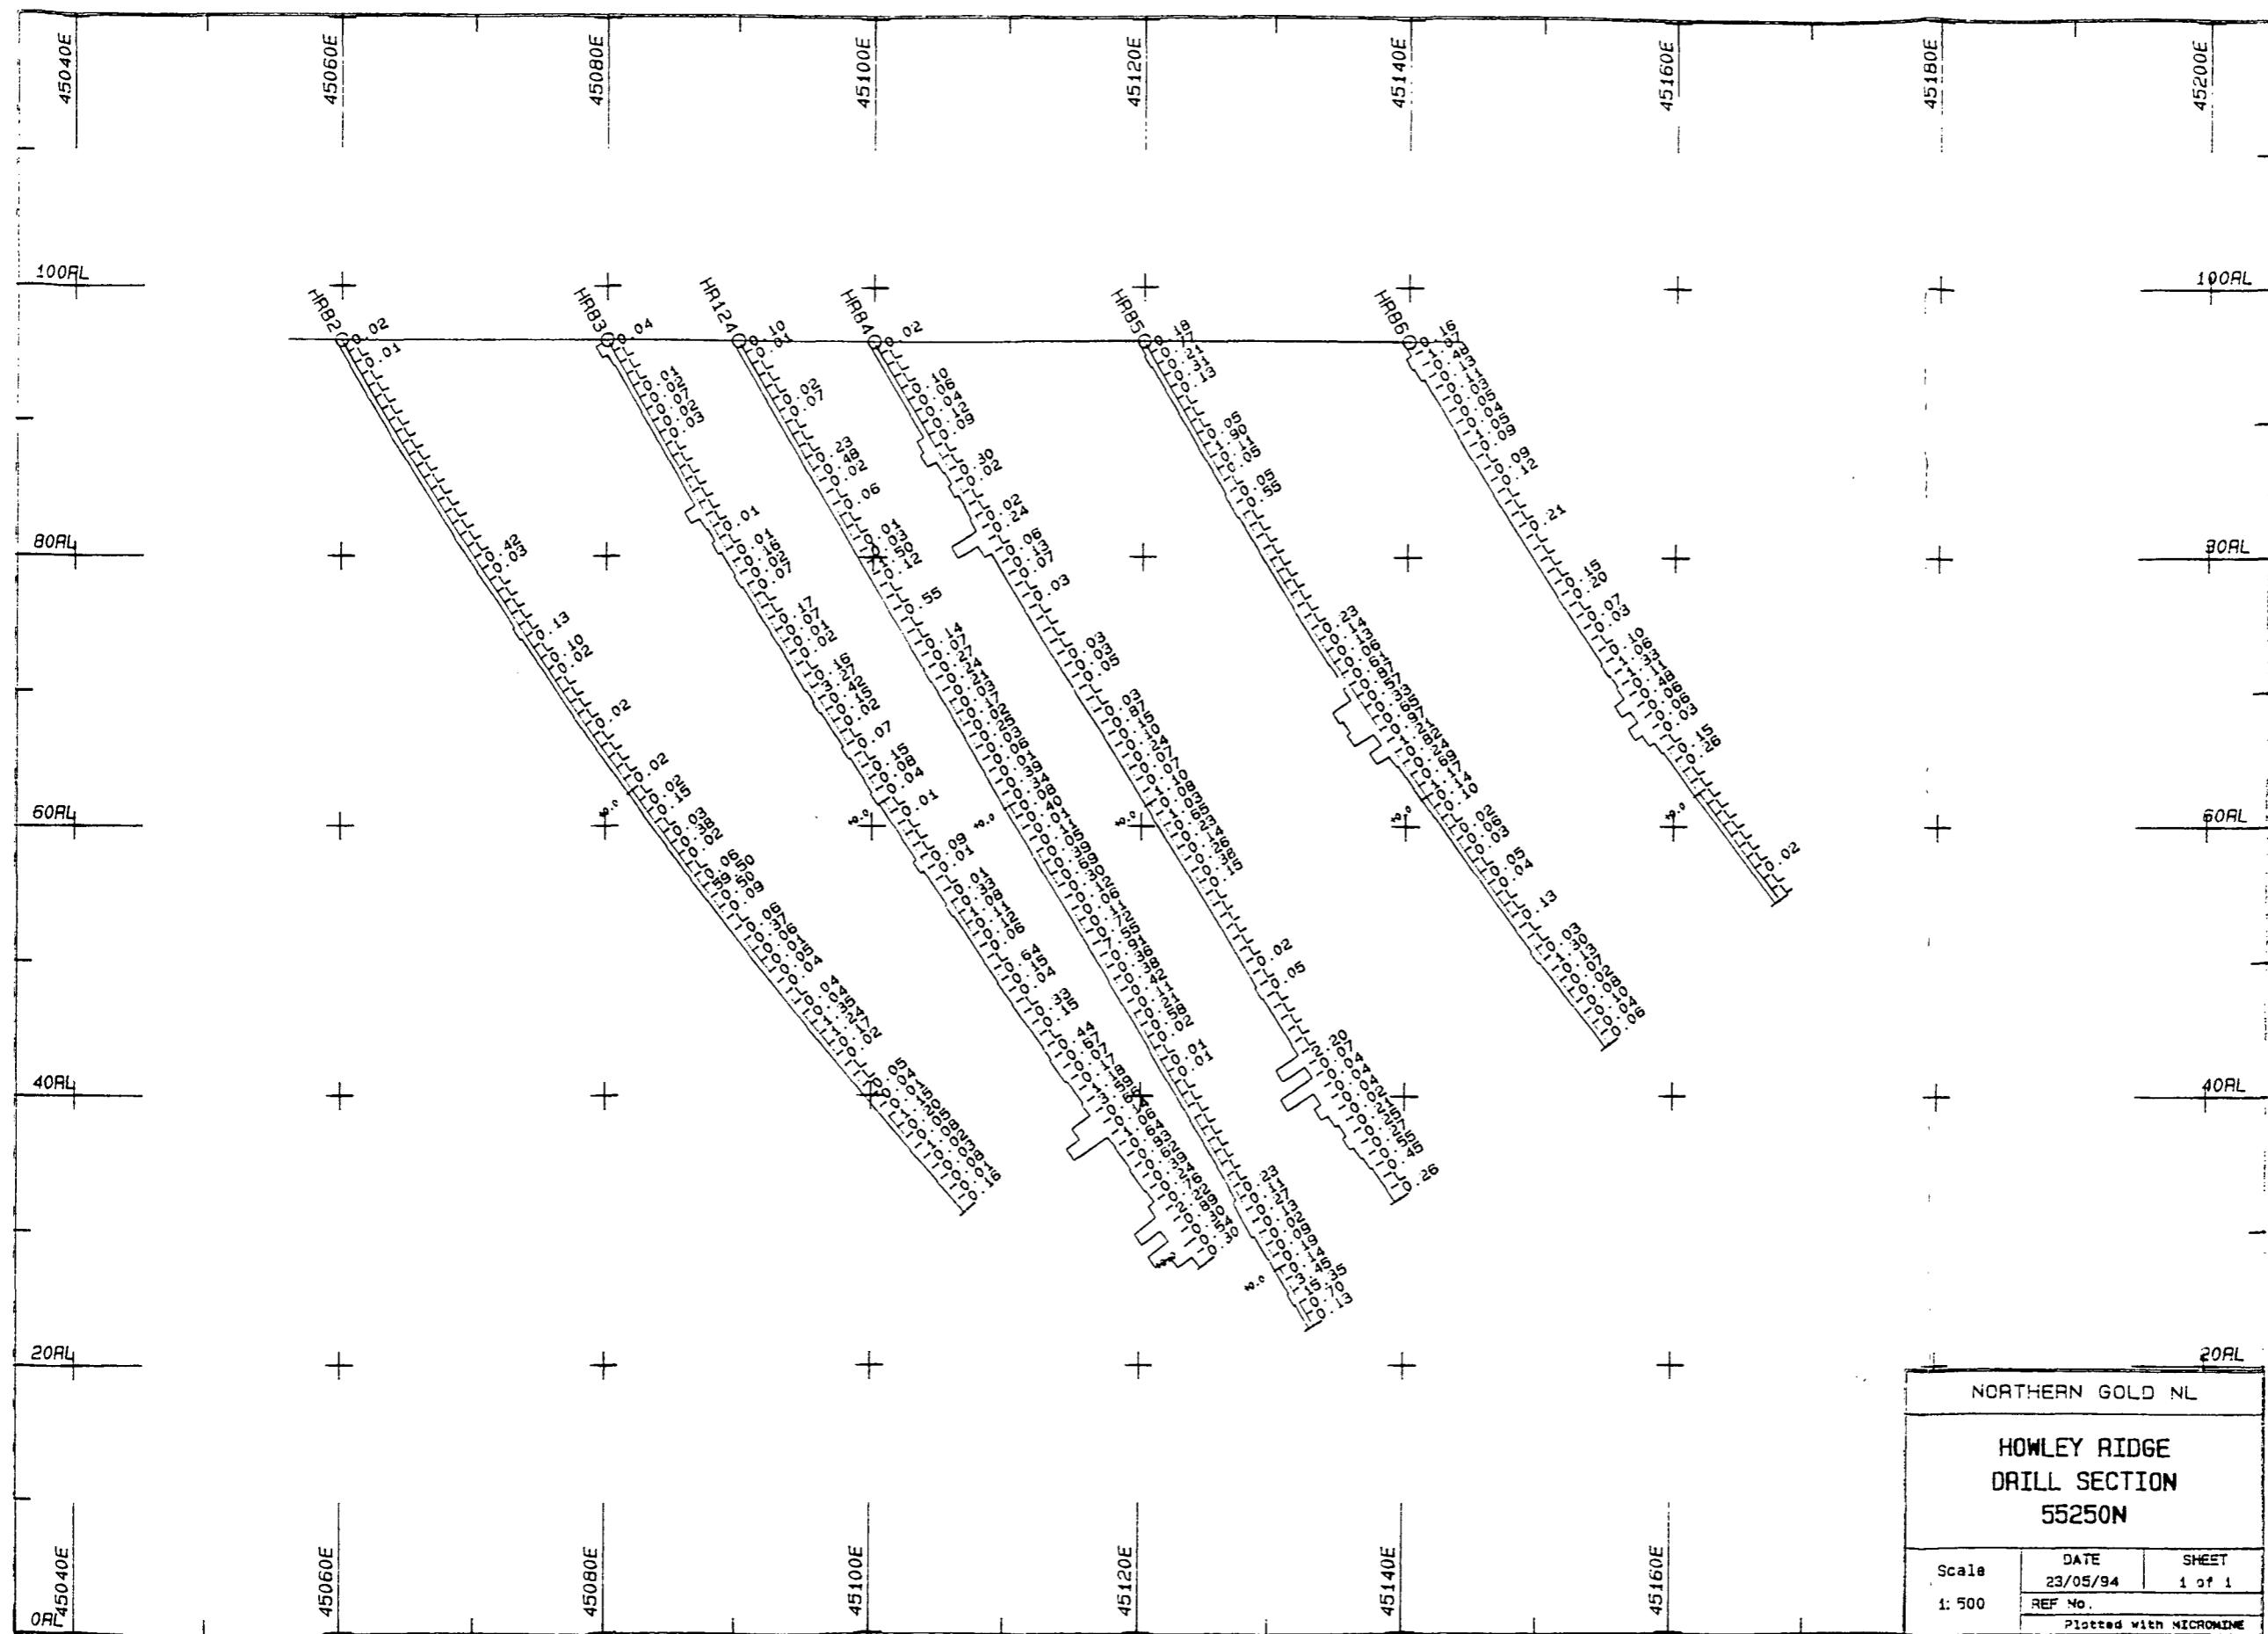

Gomex Drilling was contracted to conduct the drilling, and supplied a RCD 150 drill rig with 600psi *950/350cfm compressor, booster, driller, two assistants and support vehicles. All RC drilling utilised a 5 1/2 inch face sampling hammer. A Northern Gold geologist was on site at all times to manage the program. Site preparation involved clearing of lines with minimal disturbance to surrounding trees and landscape. All samples were split through a 8:1 riffle splitter mounted on the drill rig with the small sample collected in a calico bag for analysis and the remainder collected in a plastic bag for retention on site.

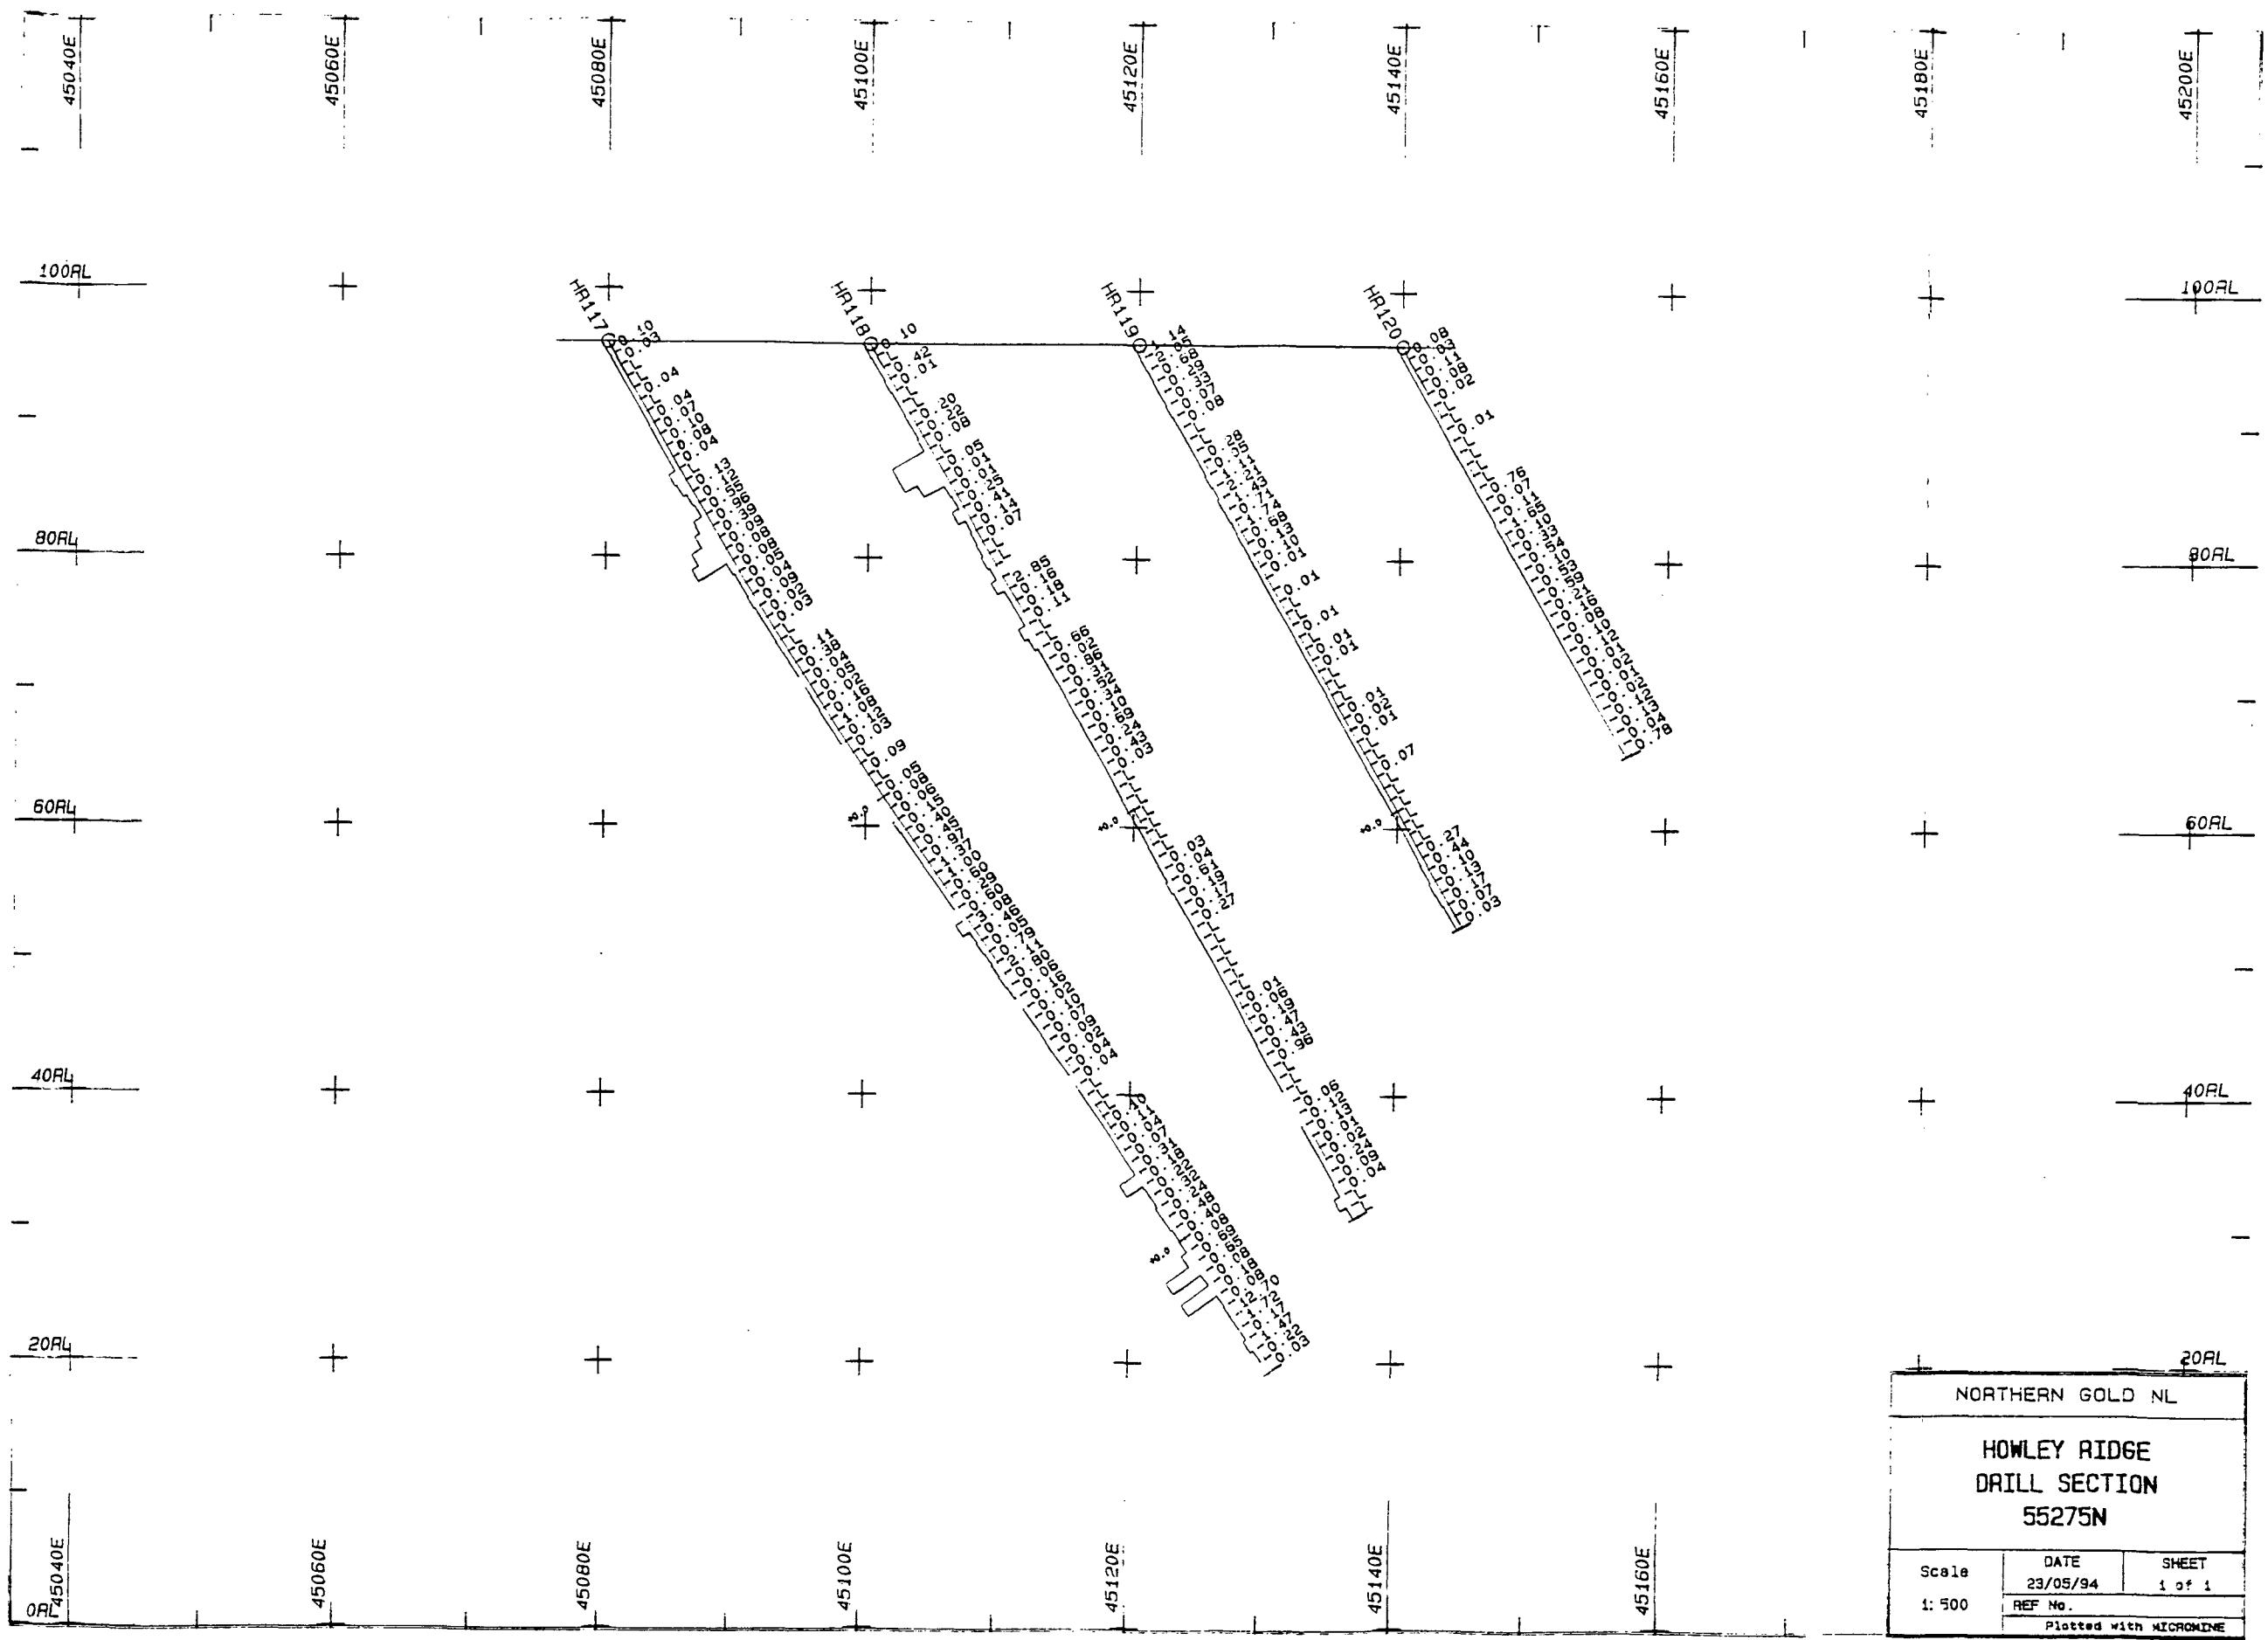

4.2 Resource Drilling Results

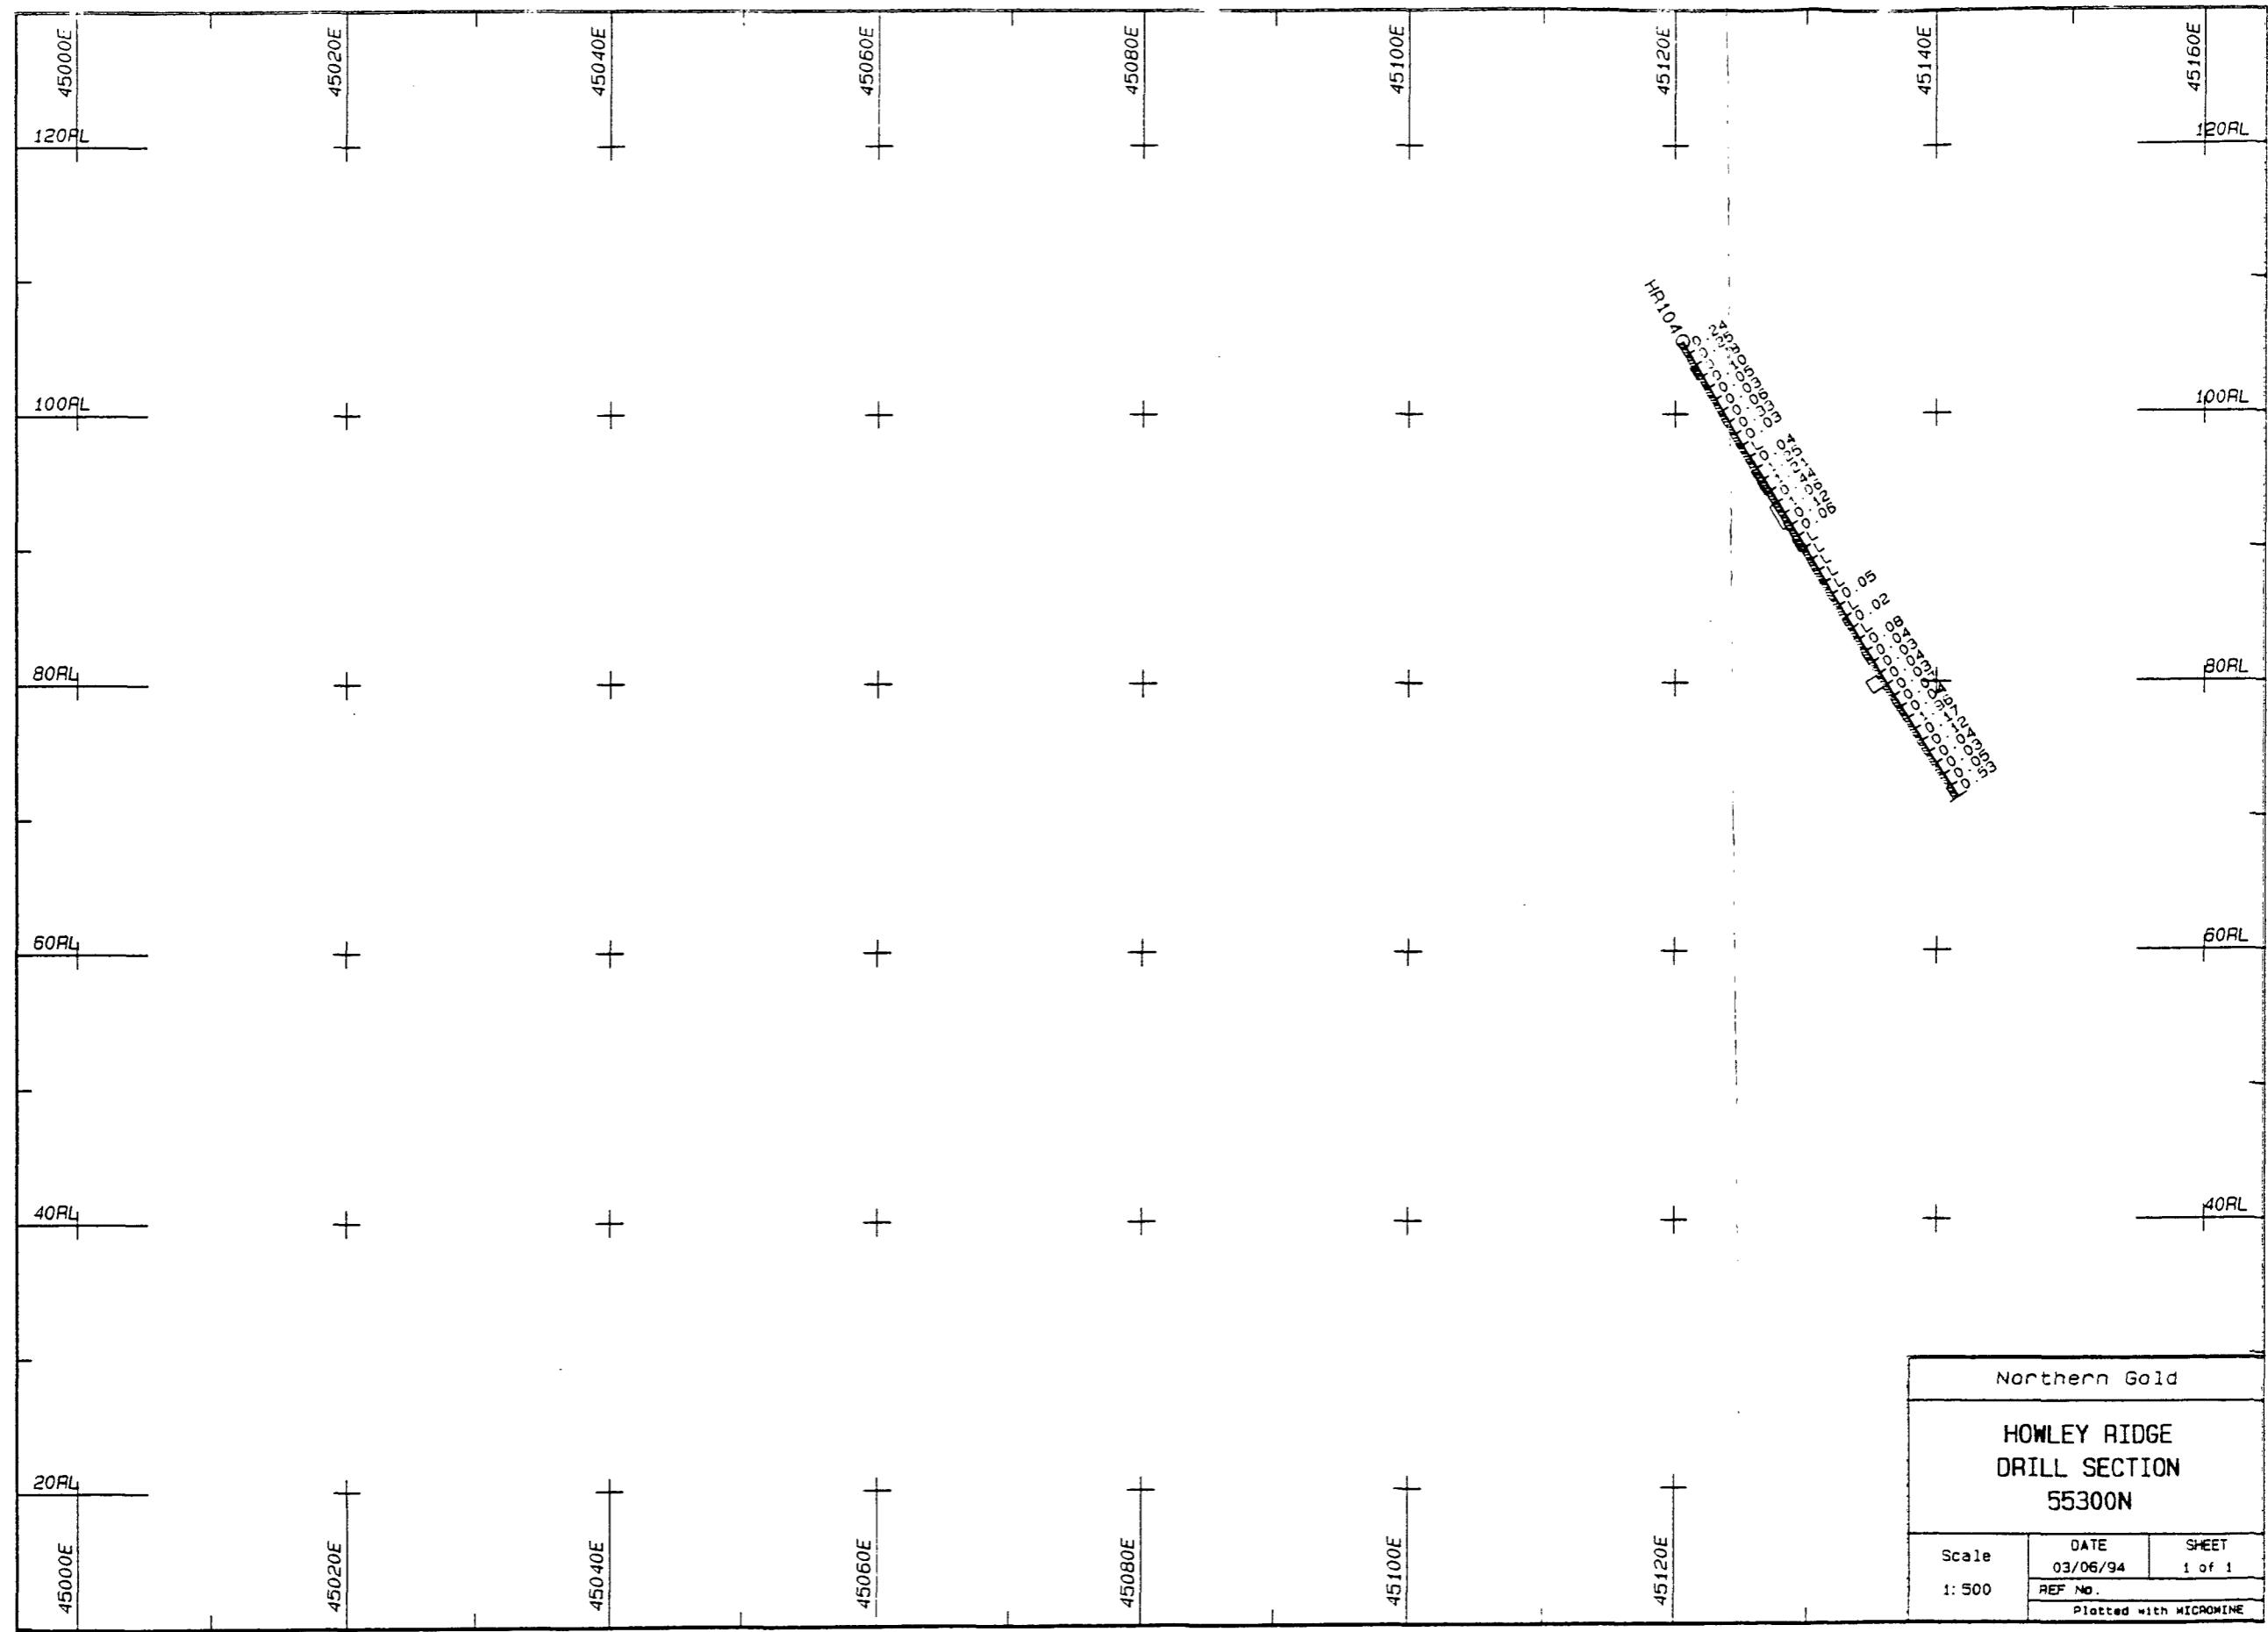

The aim of the resource drill program was to test the northern and southern strike extent of the “Nugget” resource, and to close off mineralisation to the east. A target corridor of mineralisation was identified following the hinge of the Howely Anticline north. Infill drilling was completed to test known mineralised zones.

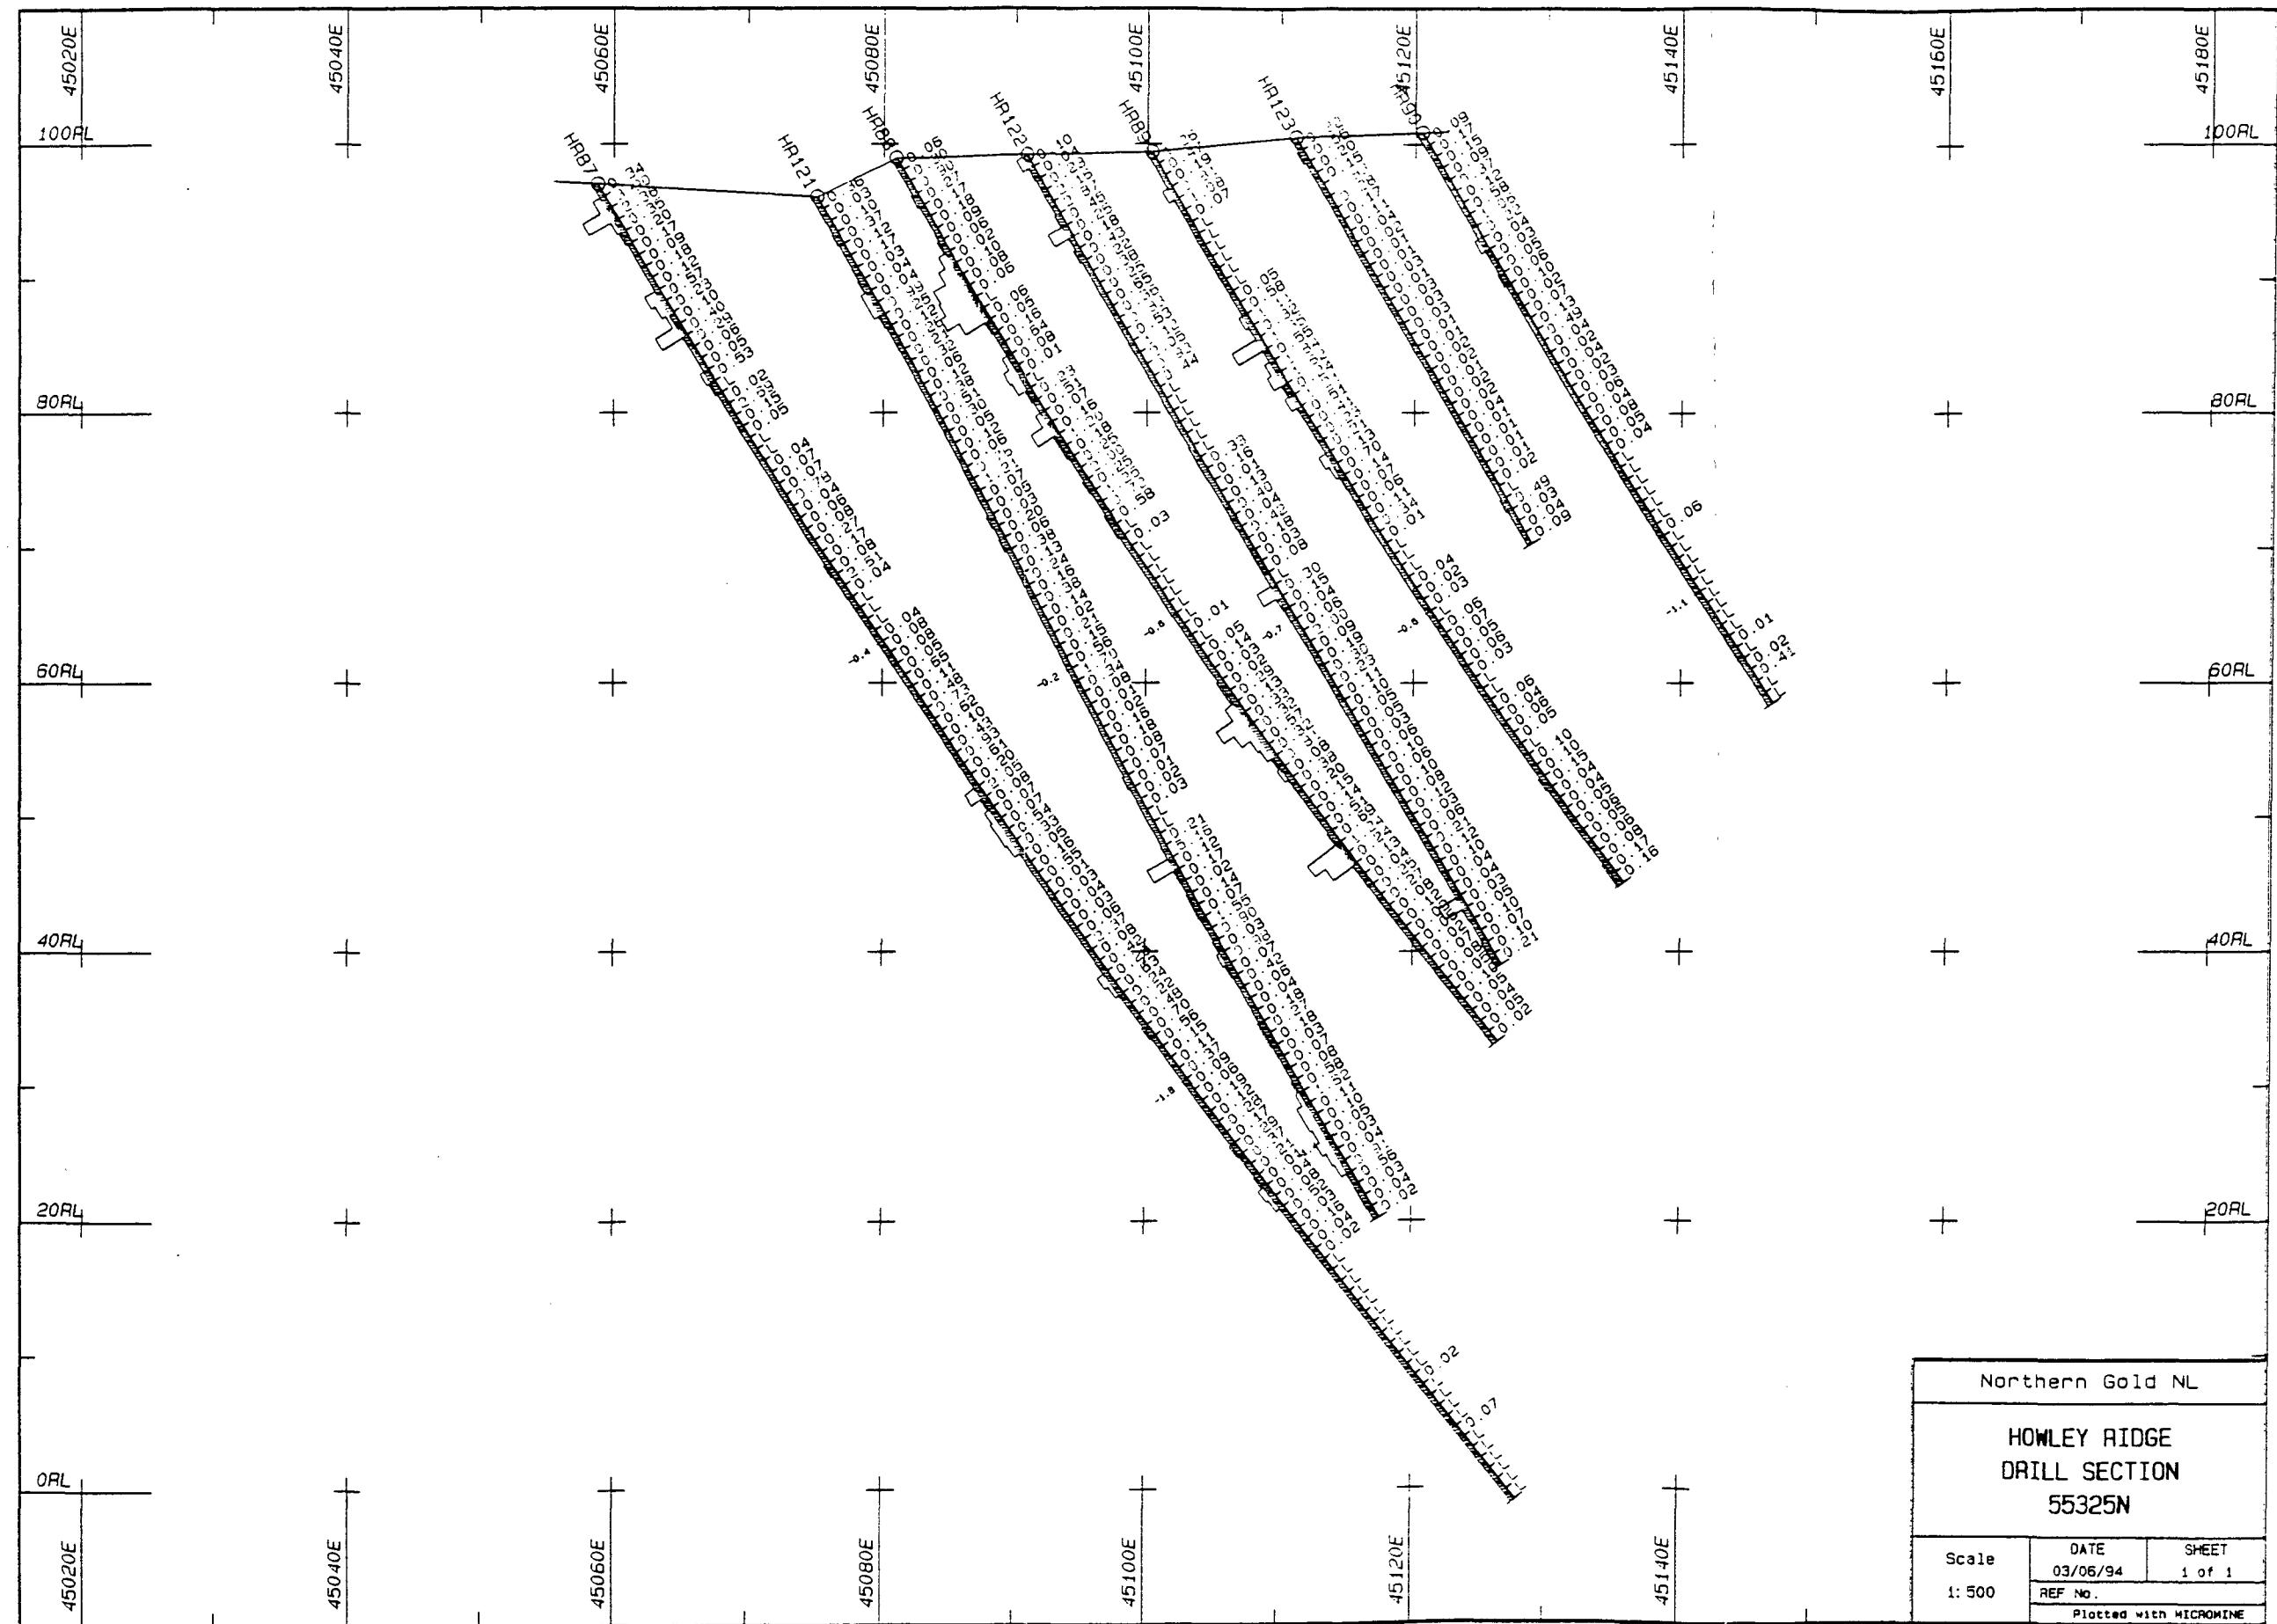

All drill holes were planned with azimuth 90°, and inclined at -60° (minimum inclination). The drilling was initially carried out on a drill spacing of 20 metres across strike, closing down to ten metres on infill lines, and 25 metre drill spacing between drill lines. The program drilled 60 RC holes, which were completed for 3582 metres. A total of 3582 samples were submitted to Assaycorp for 50 gram fire assay quartz-flush analysis. Drill hole collar information is presented in Table 1. Assay results and drill logs are presented in Appendix 1 and shown on Figures 2 to 13. Intersections at a 0.9 g/t cutoff with a minimum width of two metres and maximum internal dilution of two metres are summarised in Table 2.

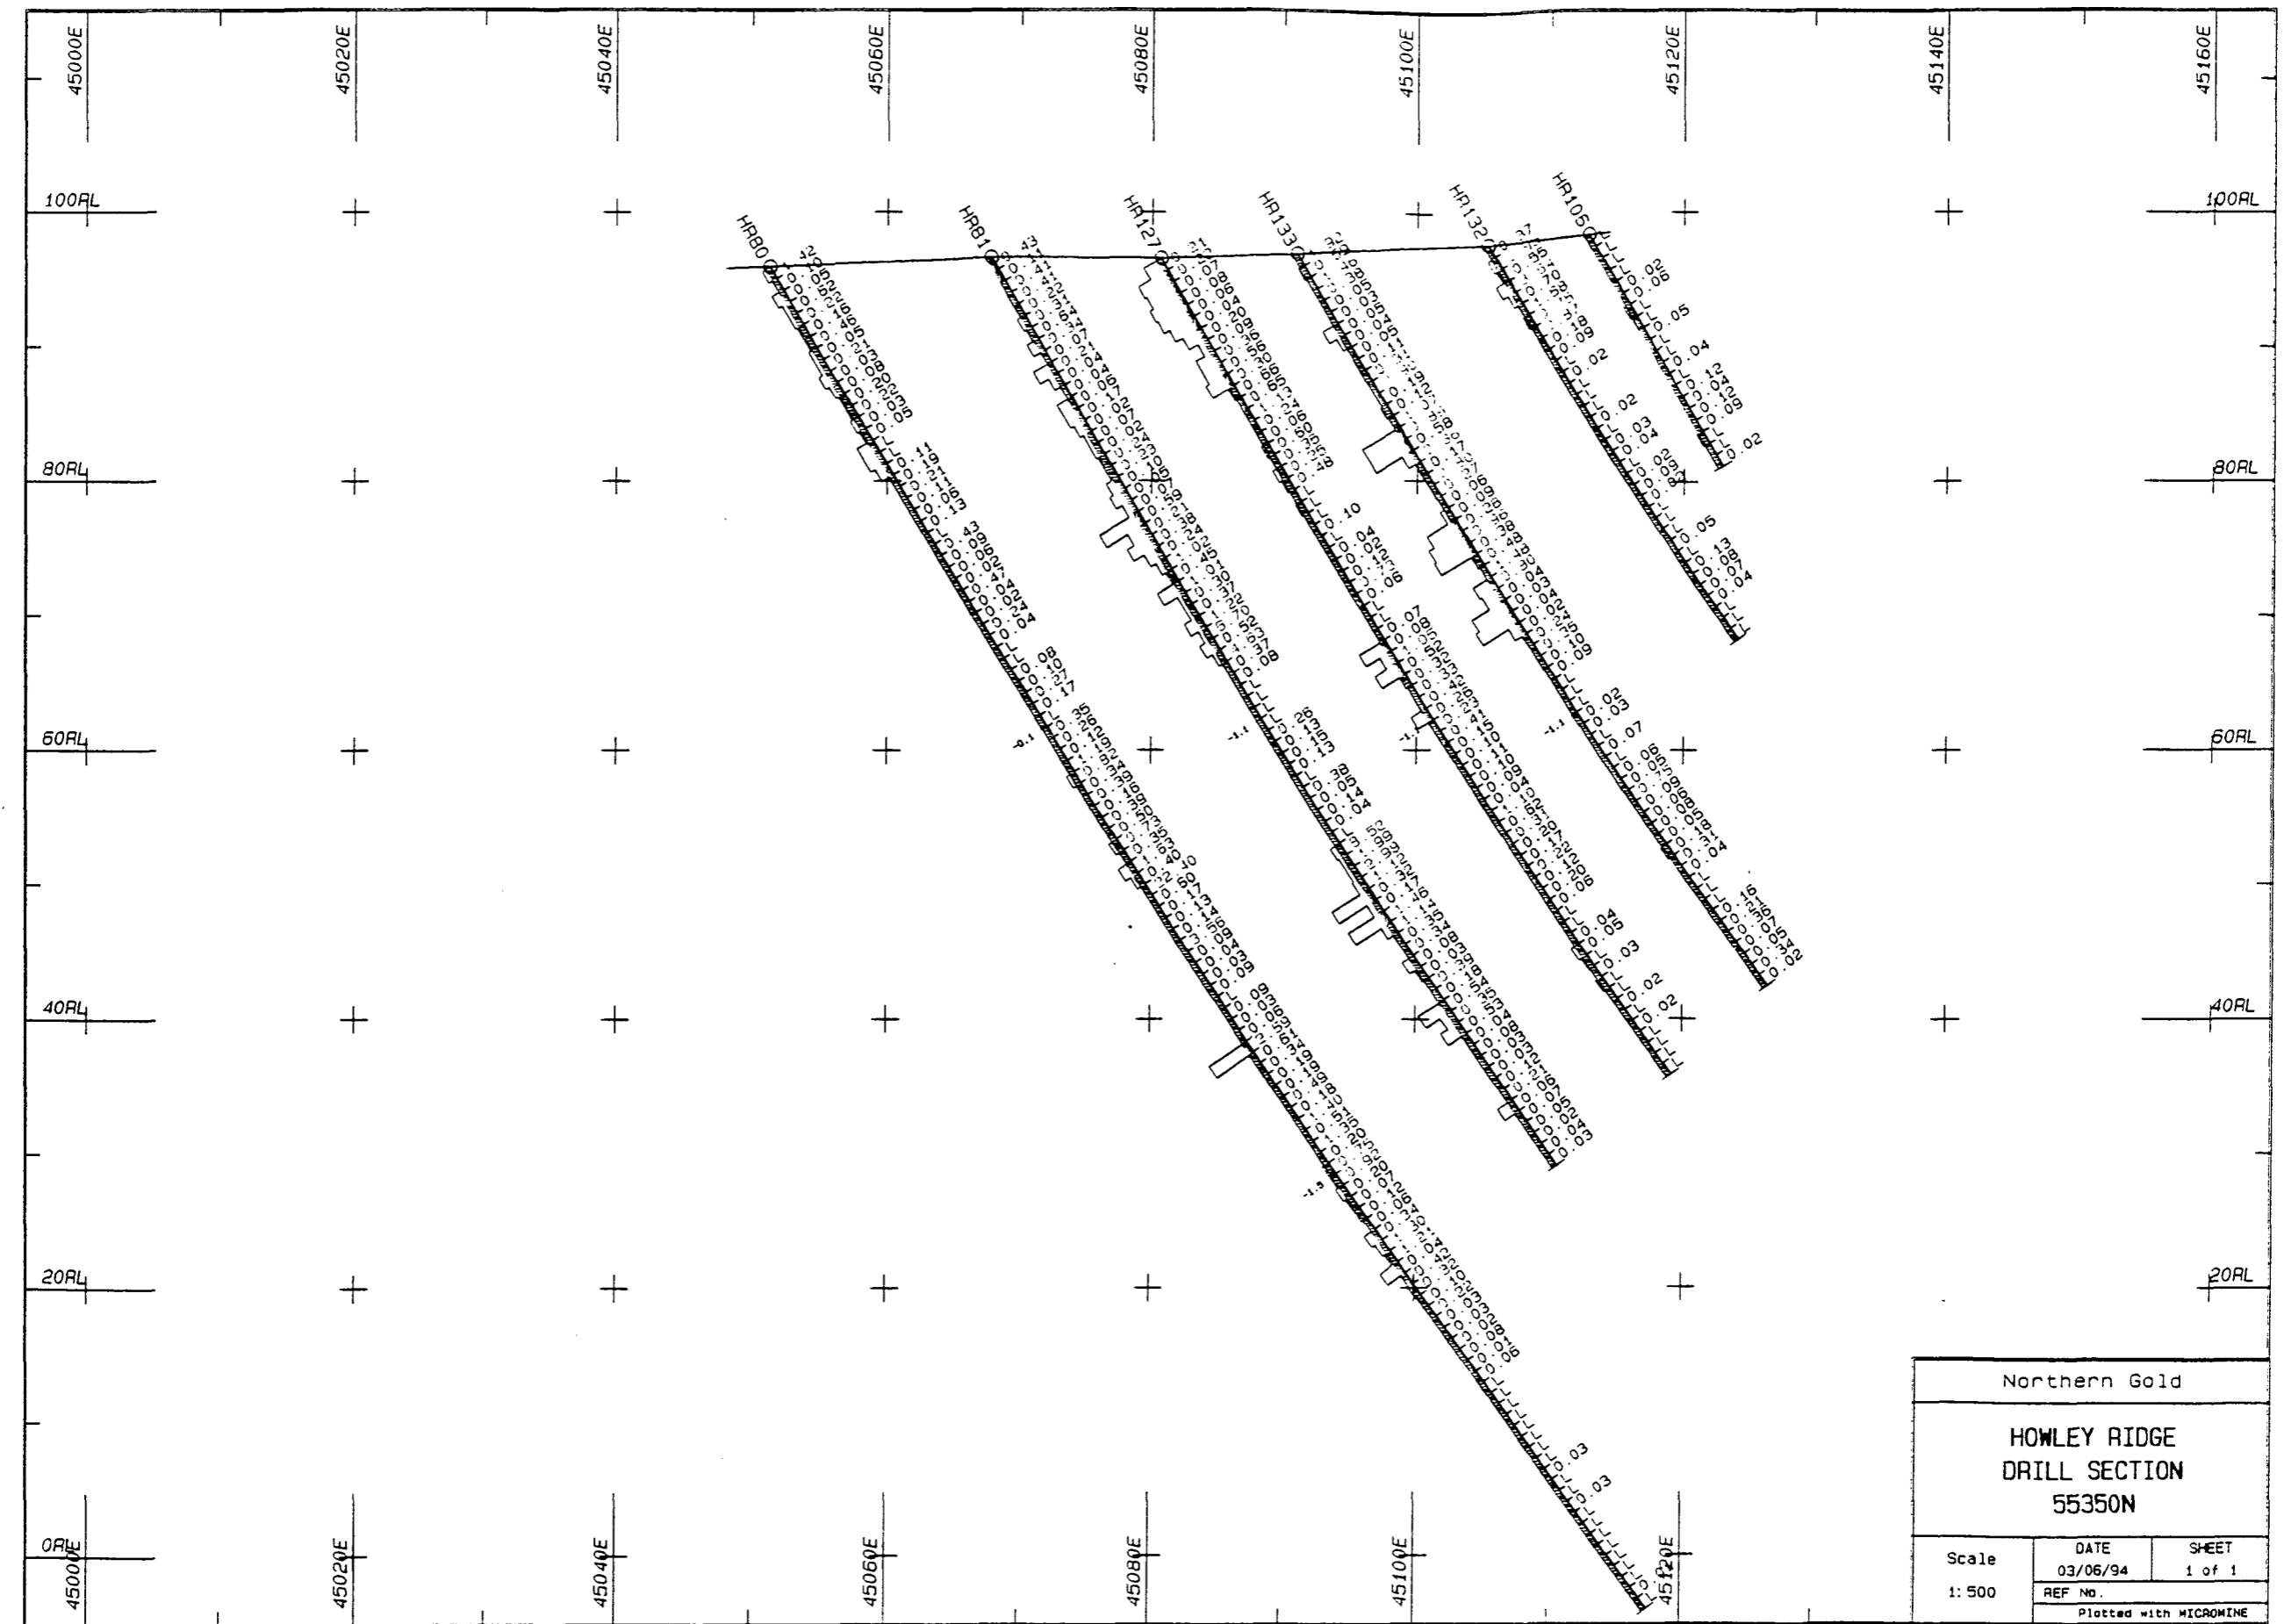

Infill drilling confirmed the presence of mineralisation as indicated by the previous drill program, and allowed preliminary resource calculations to begin. The results from the most southern drill lines were disappointing, while the most northern lines suggest mineralisation may extend further north by approximately 200 metres. The

Table 2

4.3 Rehabilitation

Rehabilitation along the two cleared lines at Howely Ridge North included removal of plastic sample retention bags, capping of holes and re-landscaping of drill pads.

5 CONCLUSIONS

The widths and continuity of the mineralised intercepts and depth of the mineralisation in the area have warranted preliminary resource calculations to begin. Further resource drilling is required to accurately delineate the extent of mineralisation north along and across strike of the Howely Anticline.
