

Australian Manganese Resources

Final Report EL 28609
“Mount Young East”
For the period
15/09/2011 to 20/10/2014

Titleholder: Australian Manganese Resources Pty Ltd

Operator: Australian Ilmenite Resources Pty Ltd (Managers and Receivers Appointed)

Target Commodities: Heavy Minerals, Iron Ore, Uranium

Project: Gulf Manganese

Date Granted: 15/09/2011

Datum/Zone: GDA94/53

1:250,000 Sheet: Mt. Young

1:100,000 Sheet: Mt. Young

Author: Ian Johnstone BSc, Grad Dip Man

Date: 15th September 2014

Contact: iankjohnstone@gmail.com

Address: PO Box 947, Darwin, NT0801.

Phone: 0408792999

SUMMARY

This report covers activities on EL 28609 which was granted on 15th September 2011 for a period of six years to Australian Manganese Resources Pty Limited. EL28609 forms part of the eastern Group Tenements GR 271/13 (ELs 28586, 28588, 28589, 28607, 28608, **28609** and 28894) which were granted to Australian Manganese Resources Pty Ltd (AMR) at various dates in 2011 and 2012. Group reporting applies from February 2012. This report is the Final Report for EL28609 which was surrendered back to the Department of Mines and Energy on 15th September 2014.

The Project lies in the Batten Fault Zone within the Bauhinia Shelf of the Proterozoic McArthur Basin. The area has been historically subject to very limited exploration for manganese and other commodities by airborne geophysical methods at wide spacing that provides only basic information for an initial understanding.

The tenements are along the coast and close to the Gulf of Carpentaria. The tenements are situated within the Carpentaria Basin, a major Mesozoic-aged **sedimentary basin**. In Cretaceous times a major marine transgression laid down a sequence of sandstone, siltstone and conglomerate un-conformably over older rocks. Much of this sequence has been eroded with flat top mesas remnant in inland areas and cover (up to 100m thick) on coastal plains. Those portions of the tenements which are underlain by Cretaceous age sediments are considered to be prospective for manganese similar to that mineralization style found on Groote Eylandt.

Those portions of the tenements which are underlain by Cretaceous age sediments are considered to be prospective for manganese similar to that mineralization style found on Groote Eylandt.

Very little field exploration was carried out during the life of this tenement due to other commitments in the area. However a comprehensive and complete review of all available data and deposit styles was undertaken as well as an inspection of all appropriate airborne geophysical methods and data sets available that might apply to the discovery of Manganese deposits under shallow cover.

At the conclusion of this exercise it was agreed that manganese style mineralization may be evident but the exploration license evaluation did not suggest any deposits of note.

INTRODUCTION

Background

Australian Manganese Resources Pty Ltd (AMR) holds eighteen granted exploration licenses and one exploration license application in the Gulf Country of the Northern Territory within the Bauhinia Shelf of the McArthur Basin Area.

This central group of AMR tenements that form GR 271/13 include ELs 28586, 28588, 28589, 28607, 28608, **28609** and 28894. This group was considered highly prospective for base metals and for significant manganese discovery. The locations of these tenements in relation to Cretaceous occurrences are shown in *Figure 1*. EL28609 is displayed in the central portion of the map and in *Figure 1a*. AMR has surrendered all EL's within this group and Group Reporting is therefore not required.

All tenements were selected on the basis of geological similarity to that at Groote Eylandt where economic manganese deposits are preserved under Cretaceous cover. It is noted that some of these tenements fall within The Limmen National Park.

EL 28609 extends from the coast inland for 20km. Most of the tenement is within the proposed Limmen National Park. There are occasional outcrops of Proterozoic rocks however most of the EL is underlain by recent alluvium and sand. It is likely that Cretaceous sediments are present beneath the sand cover. Exploration will be difficult close to the coast due to swampy ground and mangroves.

This final report for EL28609 covers all activities on the exploration license which was granted to Australian Manganese Resources Pty Limited on 15th September 2011.

Climate

The project area has an average annual rainfall between 600-800 millimeters with most falls between November and April. It presents a humid monsoonal climate, with mild dry winters and hot humid summers often with heavy monsoonal rains associated with tropical cyclones. During the wet season, portions of the area can be inaccessible for exploration activities.

Location and Access

The exploration lease is located stretching WNW to ESE along the coast of the Gulf of Carpentaria to 20km inland approximately 300km in an east by southeast direction from Mataranka and lies within NT Portion 1333 "Lorella", NT Portion 1334 Limmen National Park. Access can best be accomplished by rotary wing helicopter or by vessel with most tracks in disrepair. The EL is bisected by Nyanantu and Manukalungku Creeks along with several other un-named water courses.

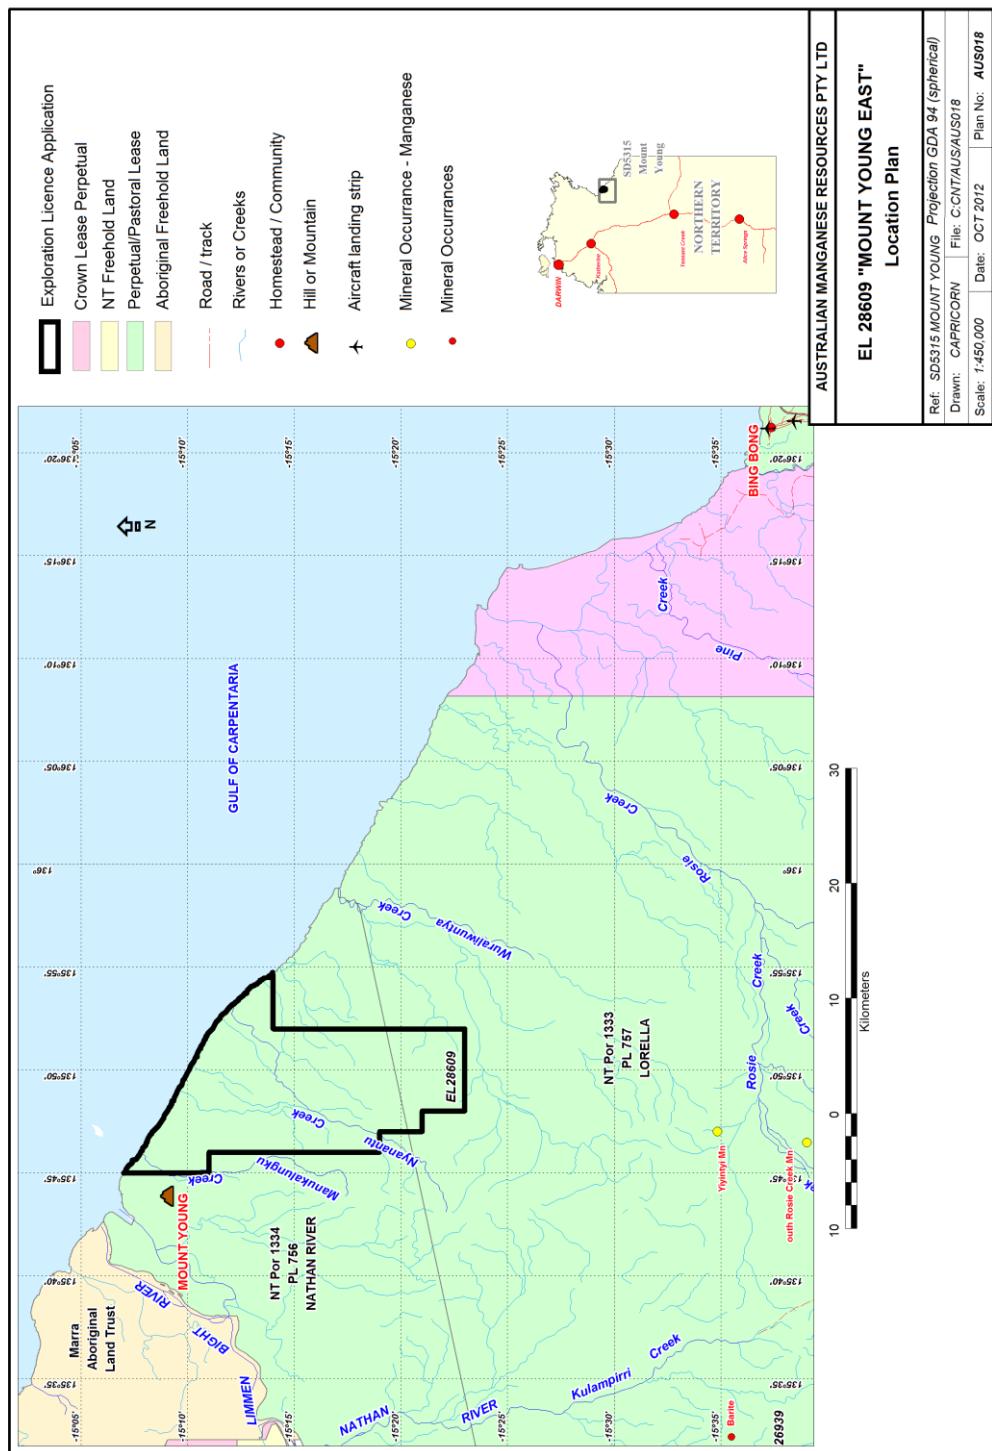

Figure 1a: EL28609 Location Plan.

TENURE

Mining/Mineral Rights

Exploration Licenses within the current Group Reporting GR 271/13 were granted to AMR Pty Ltd (Australian Manganese Resources Pty Limited) for a period of 6 years covering 286 sub blocks and 816 sq kms (*Table 1; Figure 2*). EL28609 was granted to AMR on the 15th September 2011.

Land Tenure

EL28609 resides within NT Portions 1334 the Limmen National Park and 1333 "Lorella"

Aboriginal and Heritage Sites

No archaeological or sacred site surveys have been carried out or conducted during the term of Exploration License 28609 by AMR.

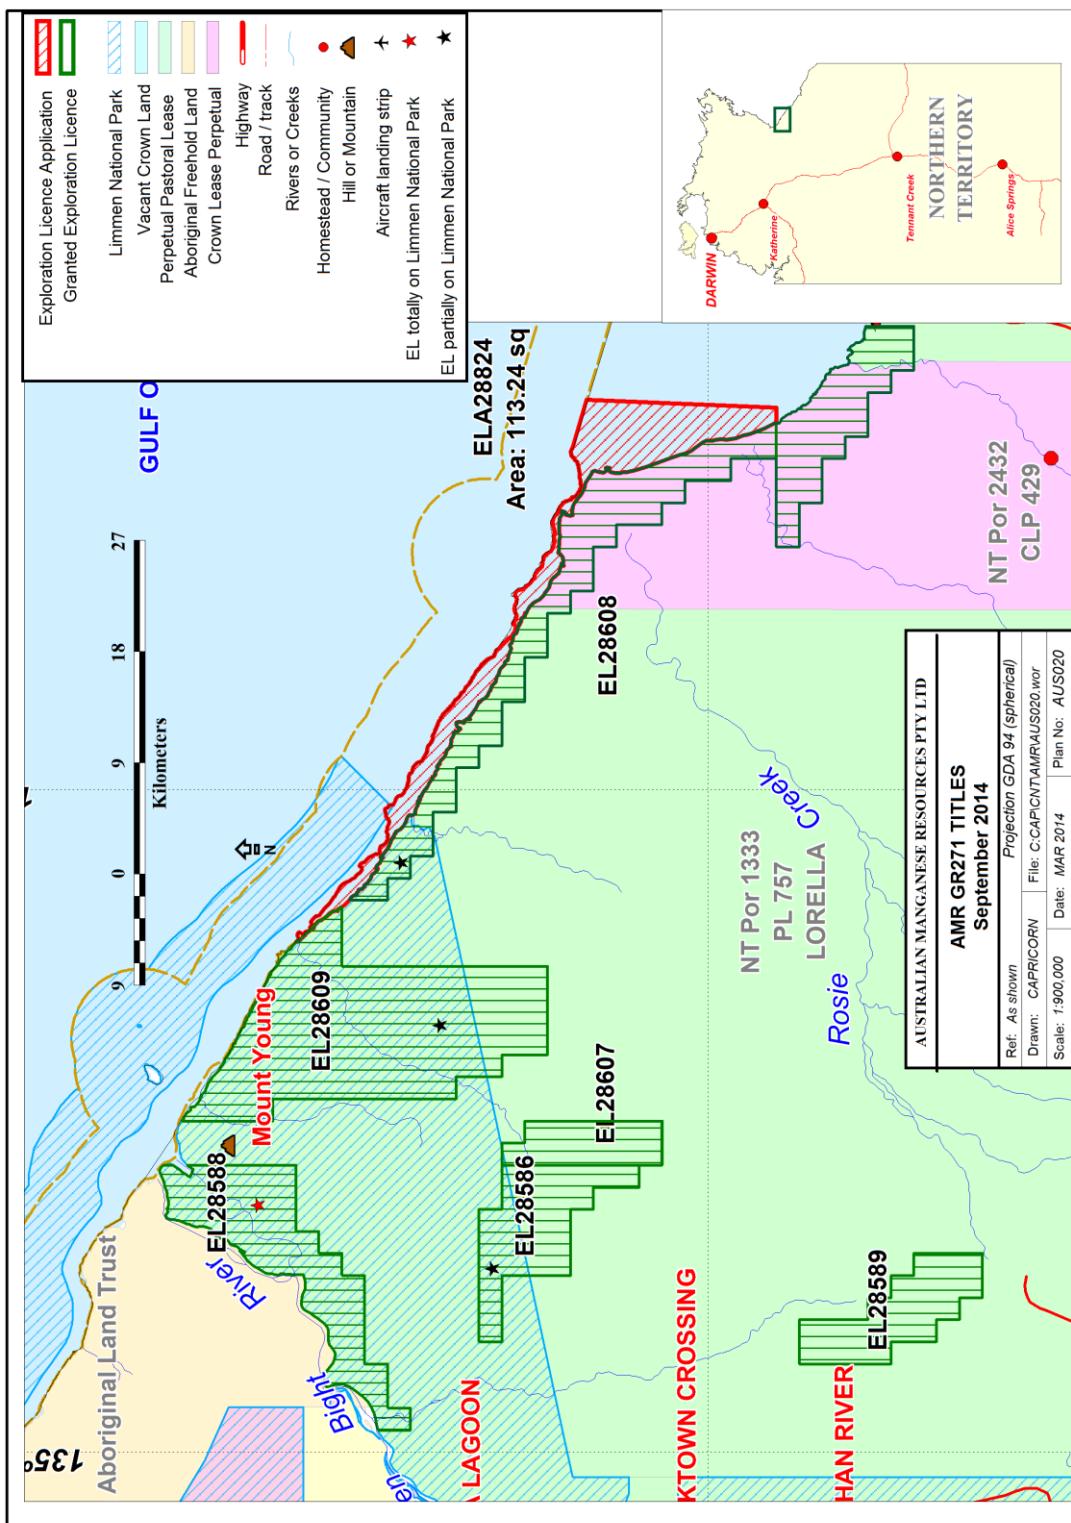

Figure 2: Eastern Group Tenements location plan (GR 271/13; 286 sub blocks) with EL28609 at 91 sub-blocks.

GEOLOGY

Regional Geology

EL28609 and all AMR Group 271 tenements are situated within the Carpentaria Basin, a major mesozoic-aged sedimentary basin. The Carpentaria Basin is a broad, north-trending intracratonic basin covering an area of about 600 000 km², about 20% of which is in Northern Territory waters. Most of the basin lies offshore within the Gulf of Carpentaria. The geology is shown on the Mt Young 1:250,000 geological sheet. The basin was formed as a gentle intracratonic downwarp in the Jurassic and Cretaceous and contains up to 1760 m of mainly Mesozoic clastic sediments (Burgess 1984). McConachie et al (1990) subdivided the basin into four sub-basins that are recognised by the characteristics of the basal Mesozoic sandstone or the basement they overlie.

Onshore in the west, the basin is flanked by Proterozoic rocks of the Arnhem and Mount Isa Inliers and the McArthur Basin, which the shelf succession overlies with angular unconformity. Basement highs separate the Carpentaria Basin from the Papuan Basin in the north and Eromanga Basin in the south.

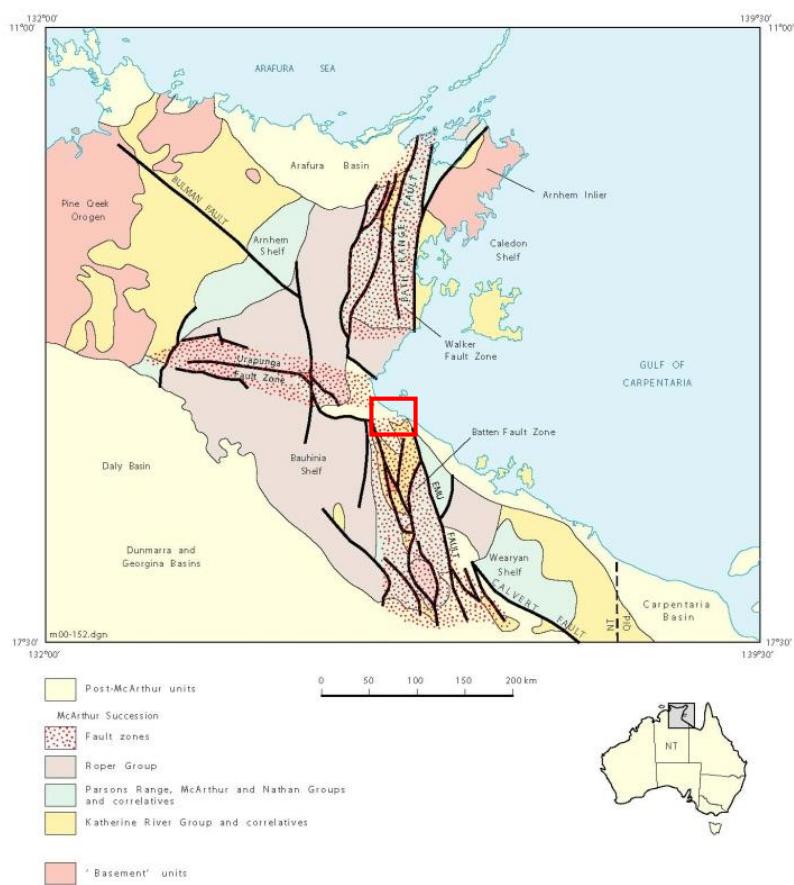

Figure 3: Regional Geology showing Project Location.

Local Geology

The tenements lie within the Carpentaria Basin at the edge with McArthur river Basin which is characterized on the east side to the Batten Fault Zone that hosts a large number of base metal prospects including the McArthur River lead-zinc mine. To the west of the Batten Fault Zone is the Bauhinia Shelf where the Roper Group contains the oolitic ironstones of the Sherwin Formation. The area to the east of the Batten Fault Zone is underlain by formations of the Wearyan Shelf.

In the Carpentaria Basin deposition commenced in the Jurassic with fluvial sandstone, minor siltstone and conglomerate in a series of basement depressions. Fluvial sandstone deposition was widespread during the Early Cretaceous. A Middle Cretaceous marine transgression brought paralic and then widespread shallow marine conditions to the basin, resulting in the deposition of a thick mudstone sequence. Pisolitic manganese was precipitated in protected coastal areas along the west coast of Groote Eylandt at this time. A late Middle Cretaceous regression resulted in the return of paralic conditions and deposition of the Normanton Formation. The Western Gulf Sub-basin is characterised by rugose basement palaeotopography and thin to absent basal Mesozoic sandstone. Fine marine sediments of the Rolling Downs Group constitute the bulk of the stratigraphic section in this sub-basin, which suggests that this part of the basin consisted of highlands with contemporaneous isolated valleys, infilled during the Jurassic-Early Cretaceous (McConachie et al 1990). Cretaceous strata of the onshore Western Gulf Subbasin consist of a thin sequence (max 100 m) of sandstone, siltstone and conglomerate, which is preserved as mesas and plateaux in a 150 km wide belt along the western margin of the Gulf of Carpentaria (Krassay 1994a). This belt represents the western epeiric shelf of the Carpentaria Basin and the extent of the Late Albian western shoreline.

During the Early to Middle Cretaceous, storm- and wave-dominated siliciclastic sediments accumulated on this gently sloping shelf. The sequence has been studied by Krassay (1994b) who subdivided the previously named Mullaman Beds into the shallow marine, manganese-bearing Walker Creek Formation and the mainly fluvial Yirrkala Formation. Extensive bauxite deposits have developed over the latter on the Gove Peninsula.

Remote sensing methods such as satellite imagery, airborne geophysics and hyperspectral mapping can be used at a regional level for base metals exploration. Imagery and remotely sensed information may be the only way to locate drill targets within EL28609.

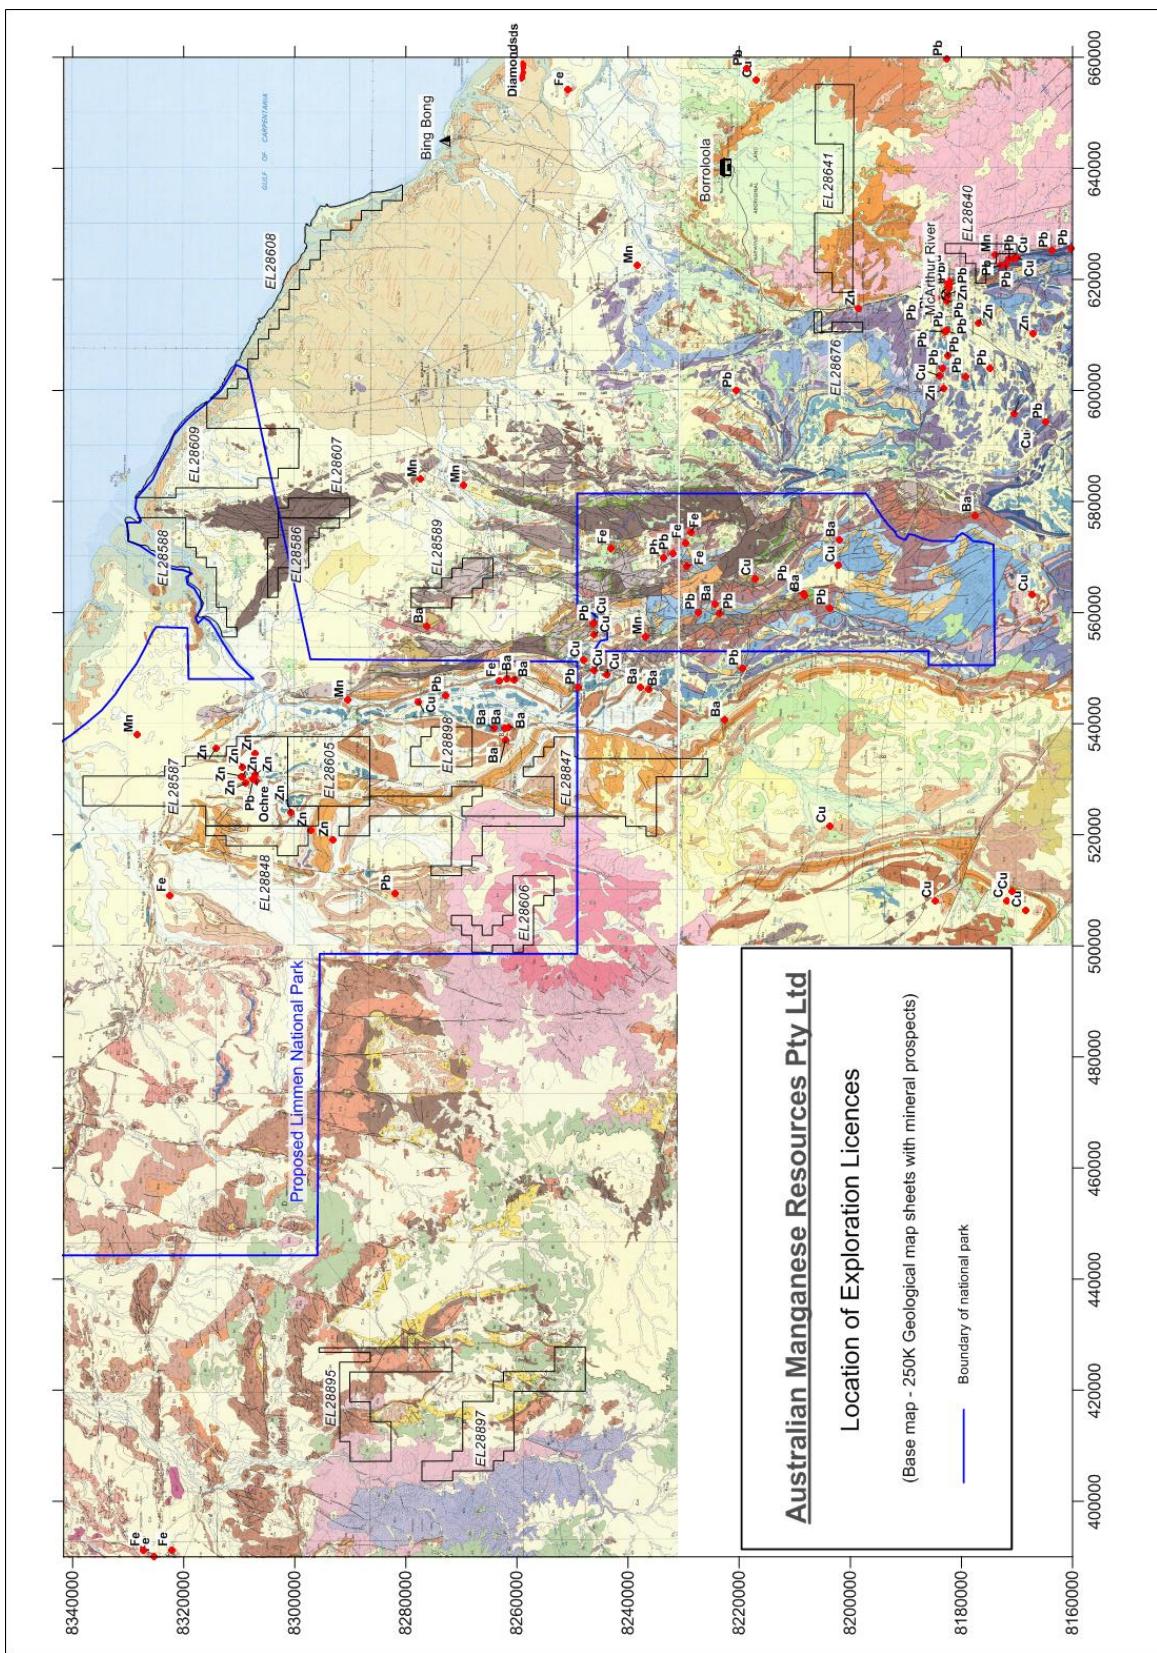

Figure 4: Local geology map of Group Tenements GR 271/13.

PREVIOUS EXPLORATION

Mining History

No previous mining has been conducted on EL28609 nor within the Group tenements.

Exploration by Previous Companies

Sporadic exploration over the western and southern margins of the Carpentaria Basin on the mainland has been conducted by various companies since 1964 (eg BHP 1964a, Chestnut et al 1967, Still 1971, Lockhardt 1977, Paterson 1997). A number of significant prospects (eg South Rosie Creek and Batten Creek) have been discovered in this region using the Groote Eylandt manganese model. Total production of manganese ore from the Northern Territory is about 50 Mt and is dominated by the Groote Eylandt operation.

BHP Minerals undertook exploration for manganese in the area covered by the AMR tenements during the early 1990's. The main techniques used were airborne and ground electromagnetic surveys (TEM) plus some drilling. Many spurious TEM anomalies were generated by saline water incursions in the coastal sediments. Minor intersections of manganese were found at the Brumby, Rosie Creek South and Yiyintyi prospects. Rosie Creek South is located close to a prominent hill of Yiyintyi Sandstone. The manganese mineralization is hosted by Cretaceous claystone at the unconformity with the underlying Yiyintyi sandstone (Ferenczi 2001).

The mineralization is represented as a stratiform, pisolithic manganese horizon within a glauconitic clay-stone which overlies a basal quartz sandstone. The Cretaceous sequence is up to 100m thick. The ore zone forms a sheet-like body up to 3m thick which occurs within a mineralized zone some 22km long and up to 6km wide. Current reserves are about 120Mt at 48% Mn.

Exploration Completed by AMR

No field exploration was carried out on EL28608 by AMR Pty Ltd, during the life of the granted tenement. Enquiries were made with Fugro Geophysical on the possibility of flying aeromagnetics to locate manganese under shallow cover in a similar way to the discovery of Groote Eylandt.

In addition, the intention to conduct helicopter based reconnaissance rock chip sampling and mapping was hampered by the lack of exploration funding. This was to be made available through the parent company Australian Ilmenite Resources. However that company was focused on trying to maintain its ilmenite production from Sill 80 on the Roper Heavy Minerals Project.

An extensive in-house desktop geological evaluation was carried out on all AMR held tenement in mid 2014 resulting in the surrender of EL28609.
