DATE: SEPTEMBER 1997

1. SUMMARY

This report details work completed on MLCs and MCCs of the Tennant Creek West Group that are subject to the Camelot-Central Joint Venture Agreement. This agreement includes Normandy Gold Pty Limited, North Flinders Mines Ltd and Camelot Resources NL. The tenements have a history dominated by exploration conducted by Geopeko up until 1991, involving airborne and ground magnetics with follow-up diamond drilling.

In 1991 North Flinders Mines Ltd entered into a sole funding Joint Venture Agreement with Geopeko and conducted an aggressive exploration programme including ground magnetic, gravity, vacuum, RAB and minor RC drilling.

In 1995 Normandy Gold Pty Limited explored the licence for ironstone hosted Au/Cu/Bi mineralisation within Proterozoic Warramunga Formation metasedimentary rocks. Work conducted on the tenements included the drilling of an RC/DDH for 250m and collection and analysis of 37 MMI samples.

2. INTRODUCTION

2.1 Location and Access

The Tennant Creek West Group of MCCs and MLCs that are subject to the Camelot-Central JV are spread over an area of 90 square kilometres to the west and north west of the township of Tennant Creek (Figure 1). The relative position of individual tenements, or tenement clusters, is summarised below in Table 1. Access to these tenements relies on station tracks from either Tennant Creek or turning off the Warrego – Tennant Creek Road. Access is difficult, sometimes impossible, during the November to February wet season.

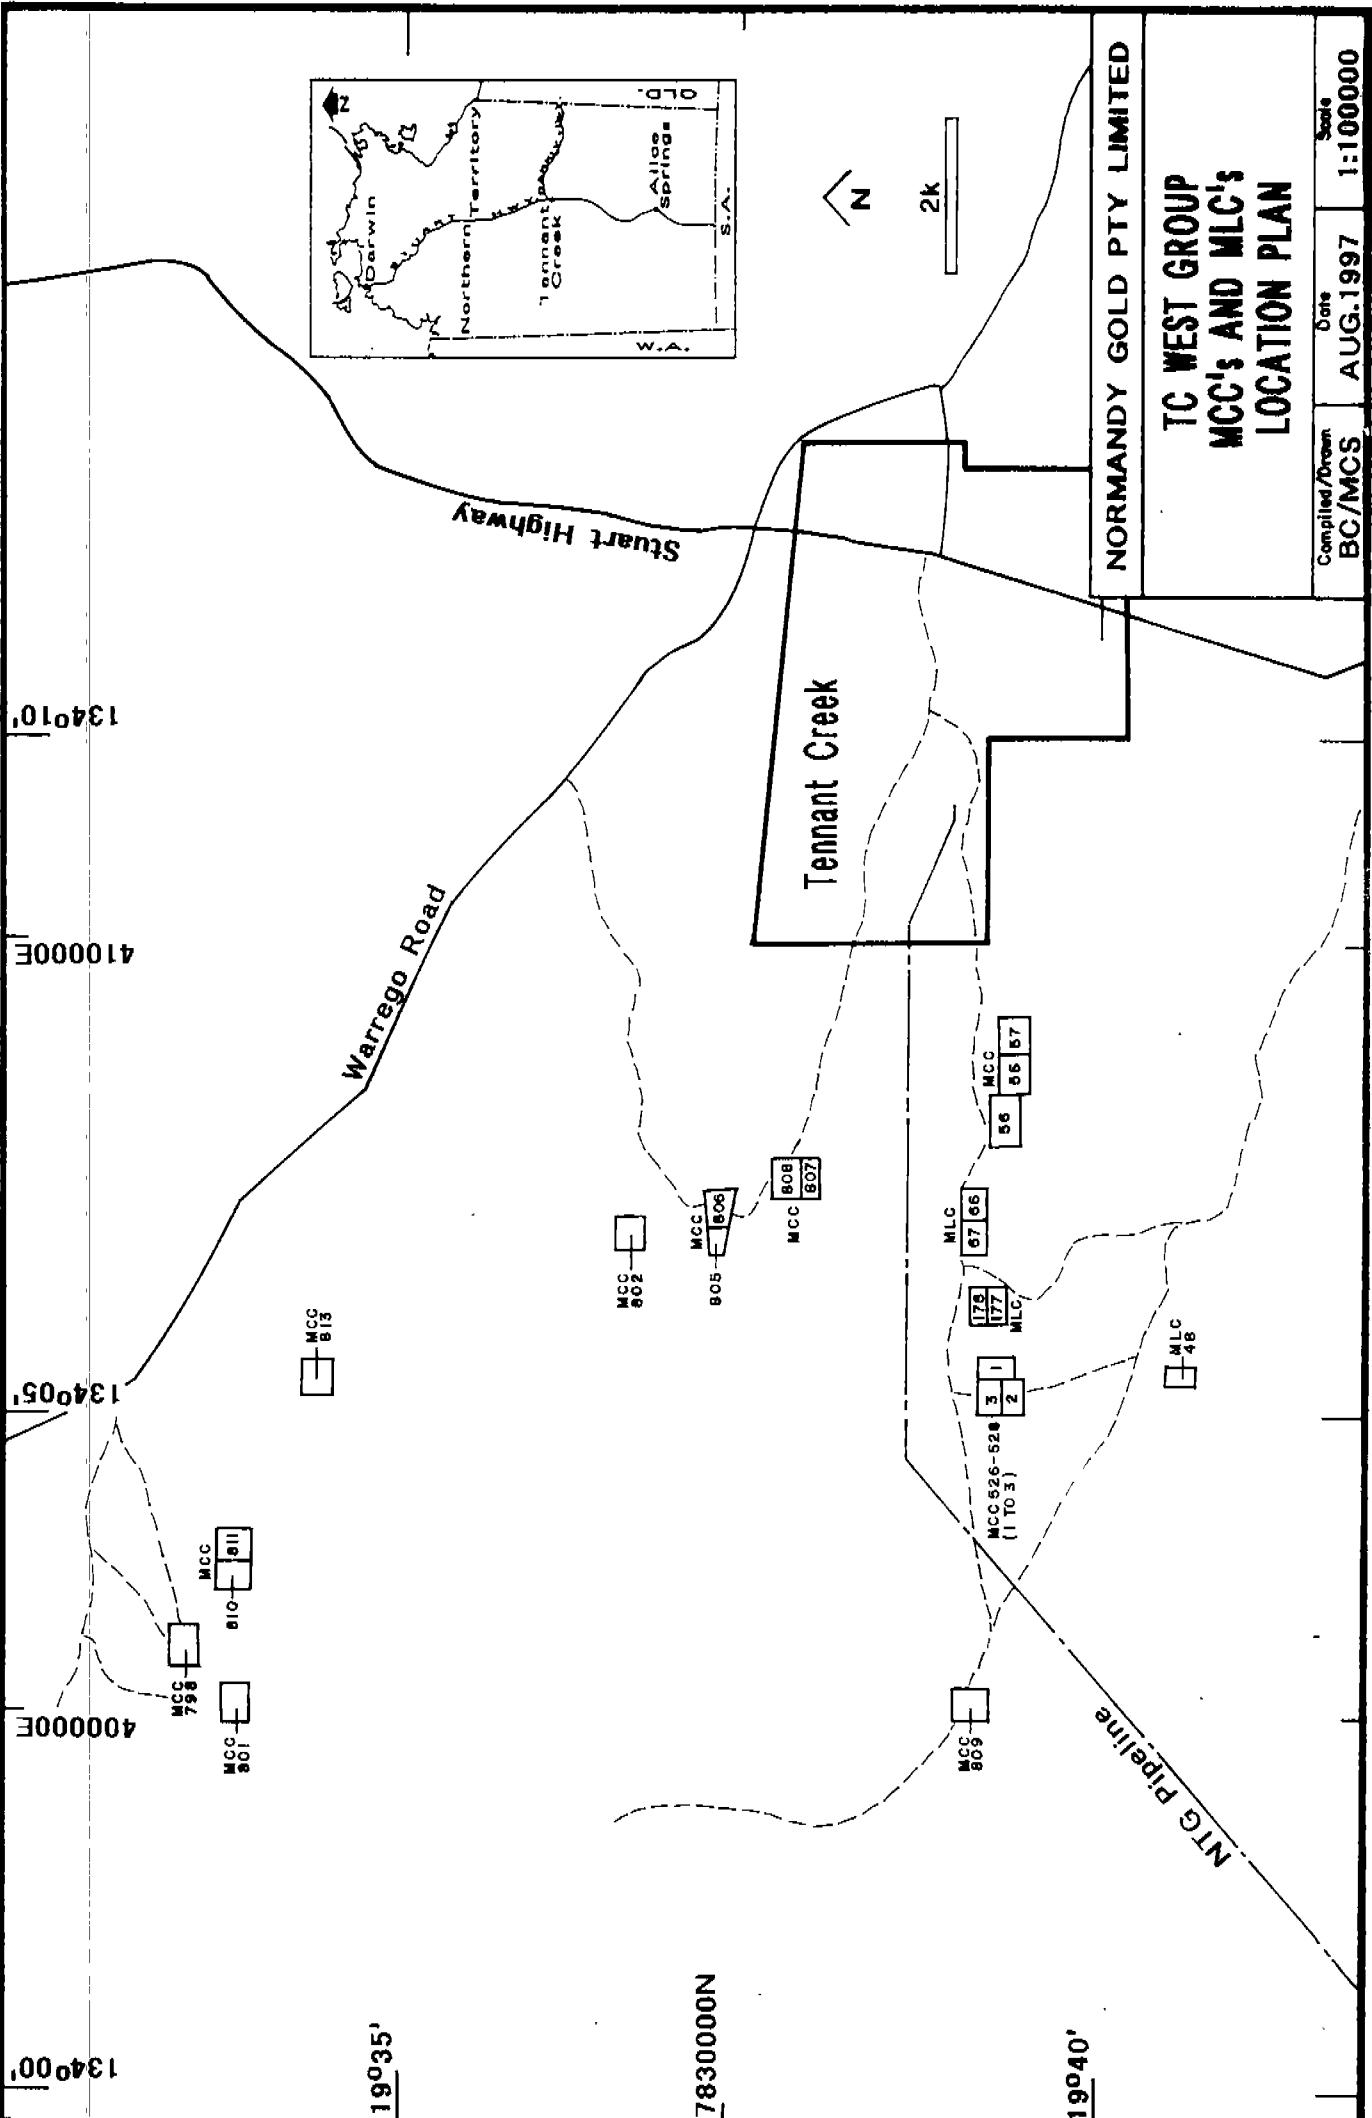

Table 1: Summary of Tenement Locations

Tenement(s)	Location relative to Tennant Creek
MCCs C55-57	7 km W
MCCs C526-528	11 km W
MCC C798	17 km NW
MCC C801	17 km NW
MCC C802	10 km WNW
MCCs C805-806	9 km WNW
MCCs C807-808	8 km W
MCC C809	15 km W
MCCs C810-811	16 km NW
MCC C813	13 km NW
MLCs C48	11 km WSW
MLCs C66-67	9 km W
MLCs C176-177	10 km W

2.2 Climate and Physiography

The climate of the Tennant Creek district is mild throughout autumn, winter and spring, with cool to cold winds in winter. High temperatures (in excess of 35°C) occur in summer, with associated seasonal rainfall in December to March, which can impede field programmes.

The majority of these tenements occur in areas of mesas rising above the alluvial sand plains, representing the Tertiary peneplain surface dissected

during the Quaternary. However, MCCs 55-7, 526-8, 809 and MLCs 66-7, 176-7 occur within the sand plains with only local rises.

2.3 Tenure

Mineral Claims Central 55 TO 57, 526, TO 528, 798, 801, 802, 805 TO 811, 813 and Mining Leases Central 48, 66, 67, 176 and 177 were originally granted to Geopeko Ltd during the period 1965 - 1988. Peko Wallsend Ltd entered into the Central Joint Venture Agreement with North Flinders Mines Ltd (NFM) in 1991, allowing NFM to earn an interest in the tenements by sole funding of exploration. Subsequently, Normandy Gold Pty Limited (Normandy) purchased Geopeko's interest in the tenements. In 1995 Normandy assumed management of the tenements and entered into a Joint Venture Agreement with Camelot Resources NL (Camelot) in 1996. The details of the tenements are summarised below in Table 2, specifying the company the tenements were originally granted to.

Table 2: Summary of Tenure Details

Tenement(s)	Area	Granted	Company	Expires
MCCs 55-57	85	08/06/83	Peko Wallsend Ltd	07/06/98
MCCs 526-528	45	29/01/88	Peko Wallsend Ltd	28/01/98

MLCs 176-177	30	25/06/74	Peko Wallsend Ltd	31/12/99

2.4 Previous Exploration

Two generations of previous exploration preceed Normandy and Camelot activities; namely a primary phase by Geopeko Ltd and a secondary phase by North Flinders Mines Ltd. This previous work is summarised in Tables 3 and 4 below.

Table 3: Summary of Previous work – Geopeko Ltd

3. REGIONAL GEOLOGY

The geological understanding of the Tennant Creek Inlier has been recently advanced by detailed geological mapping over the Tennant Creek and Flynn 1:100,000 map sheets (Donnellan et al. 1995), precision dating of stratigraphic components of the region (Compston, 1995) and regional geophysical interpretations.

The oldest exposed Proterozoic lithofacies in the Tennant Creek Inlier are the metasedimentary rocks of the Warramunga Formation, which are the host to the

ironstone Au-Cu-Bi mineralisation of the Tennant Creek Goldfield. These Palaeoproterozoic metasediments were deposited approximately 1860 Ma. Deformation and intrusion of the Warramunga Formation by volumous porphyries and granitoids occurred during the Barramundi Orogeny (1858 Ma to 1845 Ma).

Following deformation and uplift the volcanics and volcaniclastics of the Flynn Sub-Group were erupted (1845 Ma to 1827 Ma), with intrusion of porphyries and minor granitoids into the Warramunga Formation. An additional deformation event preceded the deposition of the Hatches Creek Group/Tomkinson Creek Sub-Group (1820 Ma to 1785 Ma) and the intrusion of late-stage granitoids and porphyries into both the Warramunga Formation and Flynn Sub-Group at 1650-1712 Ma.

4. LOCAL GEOLOGY

Outcropping ridges of deeply weathered Warramunga Formation metasedimentary rocks host several mineralised ironstones in an ENE trending axial plane structures, including the historical mines Ivanhoe (MCC 798), Jubilee (MCCs 805-6) and The Extension (MCC 809).

Aeolian sand plains conceal weathered Warramunga Formation rocks adjacent to areas of outcrop.

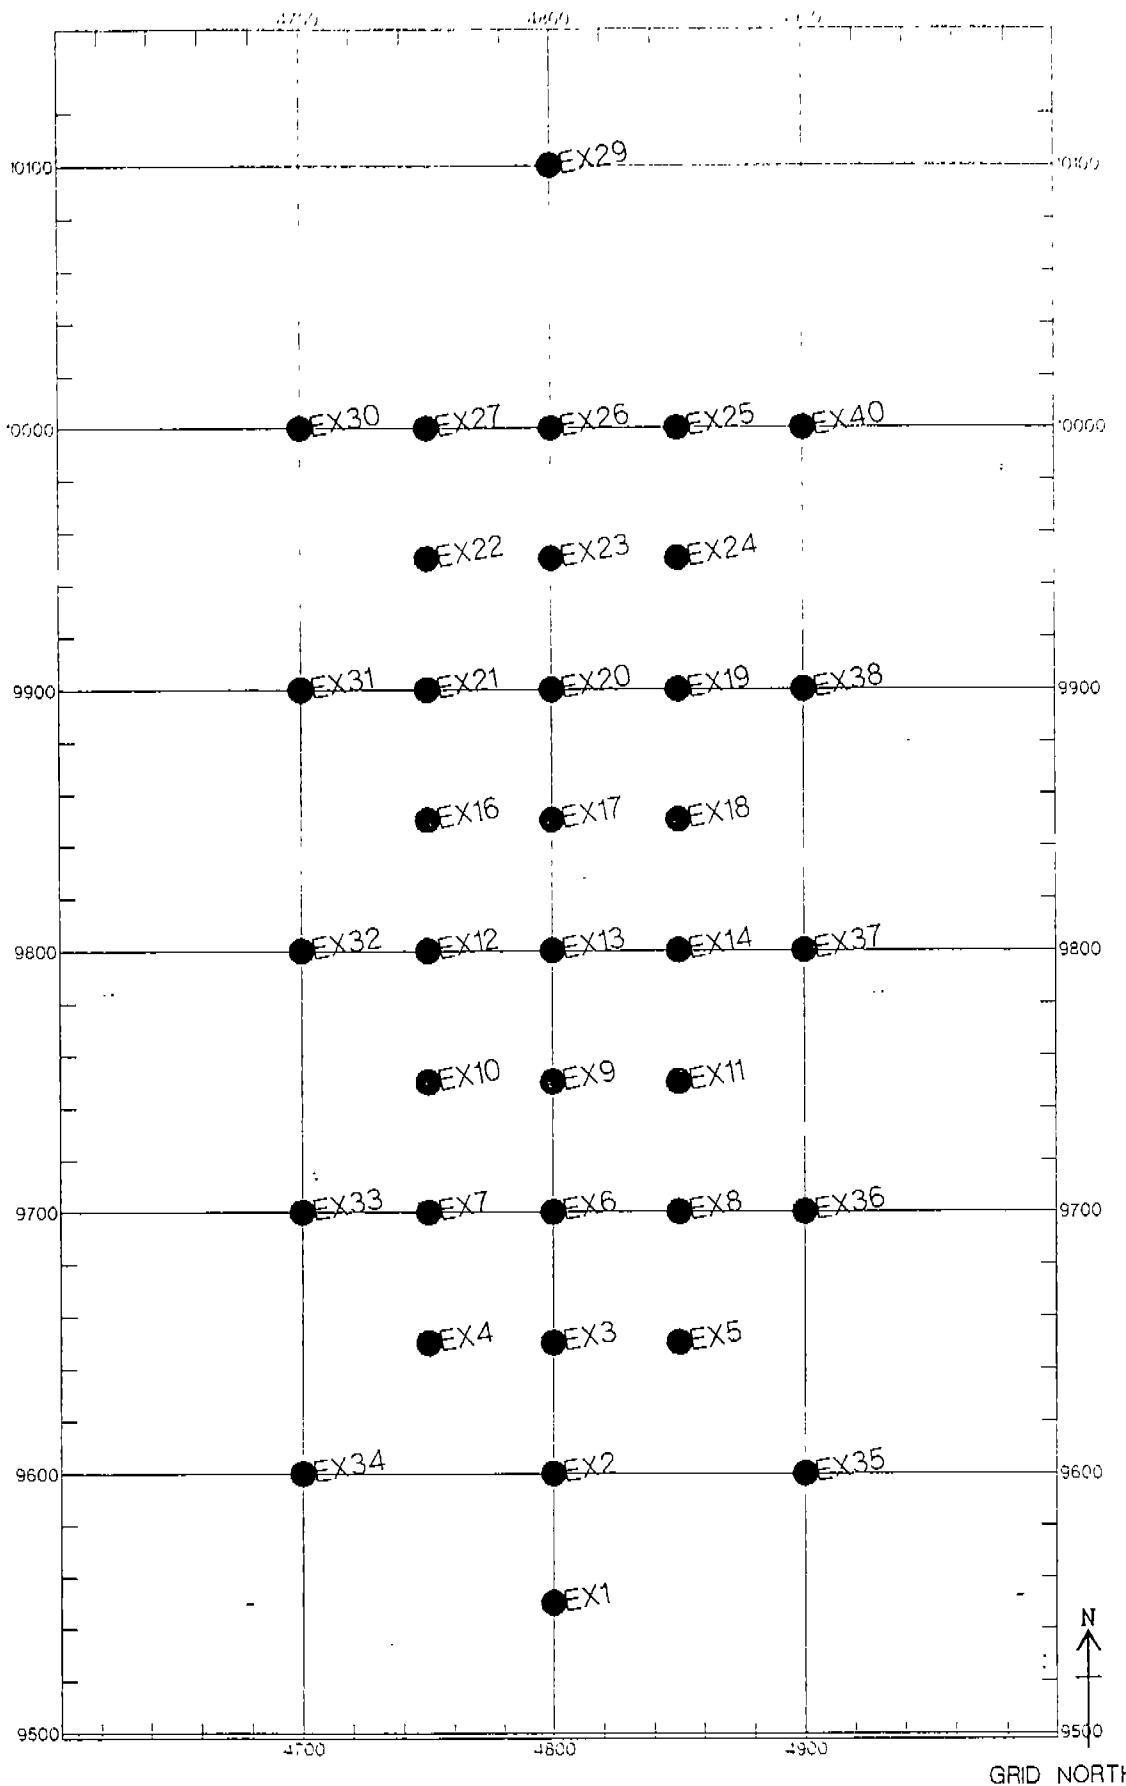

5. EXPLORATION CONDUCTED OVER THE TENEMENTS 1/9/96 TO 31/8/97

Exploration over the tenements during the reporting period focused on The Extension prospect. The exploration conducted included drilling of a RC/Diamond Hole to test at depth anomalous geochemistry identified by NFM vacuum, RAB and RC drilling. The collar co-ordinates, survey data and assay information for the drill hole are provided in Appendix 1.

Subsequently, Camelot conducted a 37 sample Mobile Metal Ions soil geochemical programme. Approximately 500g of 6mm minus surface samples were collected. Refer to Figure 2 for sample locations. Local grid co-ordinates can be converted to AMG co-ordinates with the following transformation.

Local Grid	AMG Grid
5,000 E	400375.18 E
10,000 N	7826948.12 N
Local Grid North 000°43'52"	

The samples were submitted to Analabs Pty Ltd, Perth, and analysed for Cu, Pb, Zn, Cd, Au, Ag, Ni, Co and Pd by the analytical methods MS800 and MS801. Refer to Appendix 2 for geochemical results. Geochemical response was generally low except for an Au, Ag and Cu anomaly at approximately 4750E, 9800N (local).

6. CONCLUSIONS AND RECOMMENDATIONS

Drilling and other geochemical work conducted over The Extension prospect and an assessment of previous work conducted indicates that it is prospective. Similarly a study of previous work conducted over the remainder of the MCCs and MLCs also suggest they are prospective and none are recommended for relinquishment.

7. EXPENDITURE INCURRED DURING THE PERIOD 1/9/96 TO 31/8/97

During the period of tenure an expenditure of \$37,421 was incurred. A breakdown of this expenditure is listed below.

EXPENSE	COST
Employee Costs	\$ 6,167
Overheads	\$ 2,405
Drilling	\$ 16,010
Assays	\$ 2,689
Operating Costs	\$ 3,127
Specialist Services	\$ 2,983
Tenement Costs	\$ 4,040
TOTAL	\$ 37,421

8. ENVIRONMENTAL AND REHABILITATION FACTORS

Normandy Gold Pty Limited has commenced an active rehabilitation programme over much of the Tennant Creek field. This commitment has been reinforced within the Normandy Group with the appointment of a Group Environmental Engineer to oversee and implement the Group's guidelines and objectives. In addition to this an Environmental Superintendent has been engaged at Tennant Creek to design and implement the Group's objectives throughout the Tennant Creek area.

As an example of the Group's commitment to environmental issues several active rehabilitation programmes are currently being undertaken in the Tennant Creek field. These include programmes at Nobles Nob, Eldorado, White Devil and Warrego.

An Environmental Management Plan for the Company's Tennant Creek Operations (Fowler, 1993) has been submitted to the Department of Mines and Energy under separate cover (March 1993). This plan details the strategies to be implemented over various areas following completion of exploration programmes and mining operations.

LITHOLOGICAL LEGEND FOR TENNANT CREEK

ROCK TYPE / MINERALOGY / STRUCTURE, ALTERATION AND TEXTURE

ROCK TYPE

AGL	- ARGILLITE	HSH	- HAEMATITE SHALE
AMP	- AMPHIBOLITE	HSL	- HAEMATITE SILTSTONE
AS	- ALTERED SEDIMENTS	LAMP	- LAMPROPHYRE
BIF	- BANDED IRON FORMATION	M	- MAGNETITE ROCK
CA	- CALCRETE	PEG	- PEGMATITE
CG	- CONGLOMERATE	QFP	- QUARTZ-FELDSPAR PORPHYRY
CHT	- CHERT	QP	- QUARTZ PORPHYRY
CL	- CLAY	QZT	- QUARTZITE
CO	- COLLUVIUM	SBX	- SEDIMENTARY BRECCIA
CRB	- CARBONATES	SC	- SILICIC CAPROCK
D	- DOLOMITE ROCK	SERP	- SERPENTINITE
DOL	- DOLERITE	SH	- SHALE
DR	- DIORITE	SIL	- SILCRETE
EX	- EXCARBONATE	SL	- SILTSTONE
FER	- FERRICRETE	SS	- SANDSTONE
GR	- GRANITE	ST	- SCHIST
GRD	- GRANODIORITE	TF	- TUFF
GW	- GREYWACKE	NOCORE	- NO CORE
H	- HAEMATITE ROCK		

MINERALOGY

a	- amphibole	h	- haematite
act	- actinolite	j	- jasper
Au	- gold	k	- kaolin
bi	- bismuthinite	lj	- limonite
bn	- bornite	m	- magnetite
bt	- biotite	ml	- malachite
c	- chlorite	mv	- muscovite
Carb	- carbonate (undifferentiated)	po	- pyrrhotite
cc,ct	- chalcocite	py	- pyrite
cp	- chalcopyrite	Q,q	- quartz
Ct	- cuprite	s	- sericite
Cu	- native copper	sl	- sphalerite
cv	- covellite	sp	- specularite
d,dl	- dolomite	T,t	- talc
ep	- epidote	tm	- tourmaline
gn,gl	- galena	tr	- tremolite

STRUCTURE, ALTERATION AND TEXTURE

B,bI	- bleaching	Fz	- fracture zone
b	- blebs	Lm	- laminated
Bd	- bedding	Sj	- silicification
BOCO	- base of complete oxidation	Sz	- shear zone
Bx	- breccia	V	- vein (prefix mineral eg qV)
cl	- clay	\	- interbedded
Ds,ds	- disseminated	*,)	- stringer mineral
F	- fault	>	- denotes dominant lithology
Fol	- foliated	-	- grading (eg GW-SL)
