## SUMMARY

Activities on MLN's 631 – 636 and 1108 consisted of processing the existing stockpiled oxide copper ore into copper cement using sulphuric acid leach.

264.13t of copper was sold during the year.

There was no mining undertaken during the period.

Work continued to establish additional leach vats to enable more ore to be placed under irrigation.

Work began prior to the wet season on relocating transitional ore located on the ROM pad onto plastic. This will contribute significantly to environmental improvement on the site.

Expenses for the year totaled \$1,049,463.

Relocation of transitional ore onto plastic
