1. SUMMARY

This Final Report records exploration work done on Exploration Licence 27164 (EL 27164) up to 29 August 2018.

Recent exploration carried out consisted of a regional detailed ground gravity survey, airborne magnetics survey, VRMI modelling and interpretation and predictive modelling and RC drilling.

Results from activities conducted has resulted in the prospectivity being downgraded to very low, therefore the action to surrender the title was completed and the title ceased on 29 August 2018.
2. INTRODUCTION

EL 27164 covered an area of 0.23km², approximately 5.5km north west of the Tennant Creek Township on the Tennant Creek 1:100 000 scale map sheet (5758).

The title was acquired by Giants Reef Exploration Pty Ltd (Giants Reef) to search for Tennant Creek style iron oxide copper-gold deposits (IOCG). Giants Reef is a wholly owned subsidiary of Emmerson Resources Ltd (Emmerson).

Figure 1 shows the location of EL 27164 with respect to the Tennant Creek Township.

This Final Report records exploration work done up to 29 August 2018.

3. LOCATION

EL 27164 covered an area of 0.23km², approximately 5.5km north west of the Tennant Creek Township on the Tennant Creek 1:100 000 scale map sheet (5758).

The principal access to the Licence area is north west along a series of unsealed tracks which during and immediately after rain generally become inaccessible during the wet season.

Figure 1 shows the location of EL 27164 with respect to the Tennant Creek Township.

4. TENURE

Exploration Licence 27164 Hawk, was granted to Giants Reef on the 19 October 2009 for a period of two years, with two year renewal periods granted in 2011 and 2013, 2015 and 2017. The Exploration Licence consists of one block covering an approximate area of 0.23km².

The Licence comes under the terms of an ILUA entered into between Giants Reef and the CLC, in September 2000.

EL 27164 lies within NT Portion 494, Perpetual Pastoral Lease 1142, Tennant Creek Station.

The subject title has no AAPA and CLC registered sacred sites.

5. GEOLOGY

5.1 Regional Geology

The reader is referred to AusIMM Monograph 14 (Geology of the Mineral Deposits of Australia and Papua New Guinea), Volume 1, pp. 829-861, to gain a good introduction to the regional geology and styles of gold-copper mineralisation of the area.

In 1995 the Northern Territory Geological Survey released a geological map and explanatory notes for the Flynn 1:100,000 sheet, which covers the area of the licenses.

The rocks of the Warramunga Formation host most of the orebodies in the region and underlie most of the Exploration Licenses.

5.2 Local Geology

The Licence area is underlain by sandstones, siltstones and other sediments of the Palaeoproterozoic Warramunga Formation. This formation is host to all the magnetite-haematite (ironstone-hosted) gold-copper-bismuth mineralisation and ore bodies in the Tennant Creek goldfield.

In 1995 the Northern Territory Geological Survey released geological maps and explanatory notes for the Tennant Creek 1:250,000 sheet, and the Tennant Creek 1:100 000 sheet 5758, which covers the area of the title.
6. EXPLORATION

6.1 Targets and Concepts

Proterozoic Inliers world-wide, and particularly in Australia, are renowned for their iron-rich mineralisation and world class base metal deposits. For many years prominent geologists and researchers in the industry have pointed out the geological similarities that the broader Proterozoic Tennant Creek Inlier shares with the Gawler Craton, host to the Olympic dam deposit, and to the Eastern Succession of the Mt Isa Inlier that hosts the Ernest Henry and Selwyn deposits. These similarities, though recognised, had not been widely acted upon by the industry.

Exploration was aimed at discovering large deposits of base metals along with substantial gold and/or silver, probably accompanied or hosted by large volumes of iron oxide minerals.

Emmerson’s target model iron oxide-rich lithologies and are therefore likely to be associated with regional or district-scale gravity anomalies, and potentially coincident with a magnetic anomaly.

The discovery of the haematite-magnetite Chariot deposit in 1998 has shown the potential for variations on the classic magnetite ironstone hosted gold +/- copper deposits, where lower order magnetic anomalies, plus gravity methods can define new targets. Discoveries by Giants Reef of mineralisation such as at Malbec West, Marathon and Billy Boy further support this. Emmerson considers the potential for the discovery of mineralisation in hematite dominant ironstones in the relinquished group is limited.

6.2 Recent Exploration

Exploration conducted by Emmerson over the subject title area consisted of a detailed ground gravity survey, conducted by Fugro Ground Geophysics commenced 27 March 2008. This ground gravity survey was conducted over Emmerson’s Tennant Creek tenure package and included the subject title. The survey was conducted by three teams, each team consisted of a quad bike and rider equipped with a station meter. The three teams were supported by a Toyota Landcruiser 4WD Ute. The readings were taken on a 500m station spacing’s, on lines 500m apart oriented North – South. Readings in areas requiring more detail were taken on 50 station spacing’s on 100m spaced lines oriented North - South. The survey was completed during October 2008.

A Detailed Airborne Magnetic, Radiometric and Digital Terrain Survey was conducted by UTS Geophysics and commenced 26 May 2008. The survey included vast areas of the Tennant Creek Mineral Field (TCMF), including the subject title. The survey was flown
with a FU24 – 954 fixed wing survey aircraft on 75m line spacing’s, with 750m tie line spacing’s and a sensor height of 25m for a total Line KM of 38,278. Magnetic Data was captured using a Scintrex Cesium Vapour CS-2 total field magnetometer, Fluxgate three component vector magnetometer, RMS Aeromagnetic Automatic Digital Compensator (AADC II) and a Diurnal monitoring Magnetometer (Scintrex Envi8mag). Radiometric Data was captured using an Exploranium GR-820 gamma ray spectrometer and Exploranium gamma ray detectors.

During 2010/11 Emmerson and contract geophysical consultants, Spinifex Geophysics, further developed a processing technology, Vector Residual Magnetic Intensity (VRMI) aimed at existing magnetic data from Emmerson’s Tennant Creek tenure package, figures 2 (pre-VRMI) & 3 (VRMI) represent the success of the VRMI technology. Immediate identification of highly prospective VRMI targets reprioritised Emmerson's target matrix during these years, the Red Bluff Area in Emmerson’s Western Project Area became the No. 1 priority area for exploration activities. Drilling during 2010 at Red Bluff confirmed the VRMI technology with significant intercepts of thick ironstones, although assay results were mixed, the successful ironstone intercepts were evidence to support

![Figure 2: Conventional Magnetics](image-url)
the development and use of VRMI technology. A VRMI assessment of the subject title further supported its initial prospectivity, although no further work from generated VRMI anomalies was conducted.

Other work included Emmerson’s engagement of Kenex Pty Ltd (Kenex) in 2012/13 to construct a predictive model for the Tennant Creek Mineral Field and included the subject title. This product was completed, but provided no further targeting for the subject title.

Kenex targets are generated from the Kenex Pty Ltd (Kenex) predictive modelling of the Tennant Creek Mineral Field, this product is a statistical predictive tool for predicting the possible prospective sites for Tennant Creek style mineralisation. The model produced many target areas which contain all or some of the essential criteria for possible economic mineralisation in the Tennant Creek Mineral Field. Emmerson is assessing the generated targets and ranking them in order of potential prospectivity. The highly ranked targets are selected for field visits and desktop data compilation and validation. All this data is compiled and some rock chipping may take place during site visits to compile a geological and geophysical assessment of the target which is then ranked for future exploration.

Emmerson provided Kenex with the Tennant Creek Datasets available, from these data sets Kenex generated 15 predictive maps of 15 key parameters, as listed in the table below. Kenex run to models a Weights of Evidence (WOE) model, which used all 15
predictive maps, a Lineal Regression (LR) model which used 12 of the 15 predictive maps and they also generated a 3D model which used 11 of the predictive maps.

A selected area for target generation is gridded into cells and these predictive maps give a numerical weighting for each cell in terms of its adherence to the parameter being assessed. The values for each parameter are combined to give a number of resultant values predicting different statistical relationships. The aim of these resultant values is to generate a target area that has the essential parameters to host Tennant Creek Style Mineralisation. Of all the resultant values Emmerson uses the Post Probability (Pprb) value to identify and rank its targets, in a range of 0 – 1, with 1 being the highest potential value and values above 0.85 to be very significant, although all targets need to be considered in the context of “if the assessed cell has a low value” is it because the relevant data isn’t significant or has it not been recorded/captured.

7. REHABILITATION

Rehabilitation required was conducted in accordance with the procedures outlined in the appropriate Mining Management Plan (MMP) – Authorisation 0461-02 Western Project Area.

8. CONCLUSIONS

Results from activities conducted has resulted in the prospectivity being downgraded to very low, therefore the action to surrender the EL was completed and the title ceased on 29 August 2018.
