## SPECIFICATIONS FOR AIRBORNE GEOPHYSICAL SURVEY

### SURVEY AREA

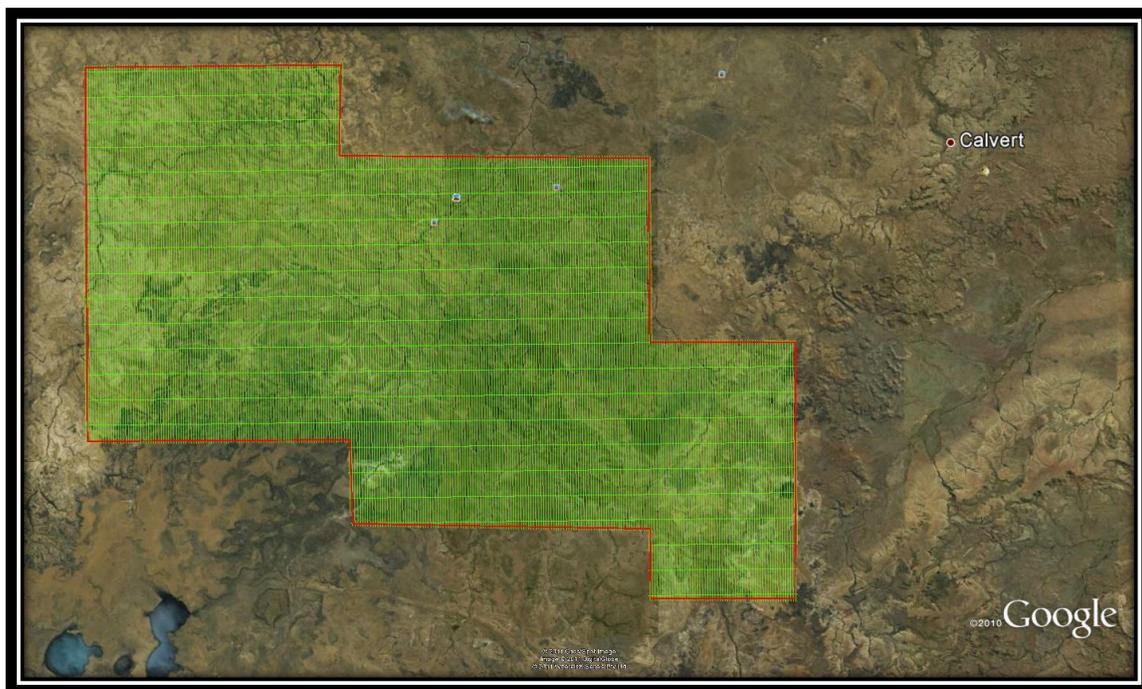

Thomson Aviation carried out a Fixed Wing Geophysical Survey of a total of 9,036 line km, South East of Borrolooloa. The aircraft used was a PAC750xl, and was based out of Redbank Copper Mine Camp. The survey was planned and delivered in GDA94 (Zone 53), a map of the survey areas, flight plan and specifications can be found below.

## FLYING SPECIFICATIONS

Flight line direction	North South
Flight line spacing	200 m
Tie line direction	East West
Tie line spacing	2000 m
Sensor mean terrain clearance	45 metres
Time base - for magnetics	0.05 sec. (< 4m)
Time base - for radiometrics	0.5 sec
Total Traverse Kilometers	7943
Total Tie Kilometers	805
Shortest Traverse	2
Longest Traverse	35
Average Traverse length	27
Shortest Tie	11
Longest Tie	56
Average Tie Length	36
Total Line Kilometers	8750

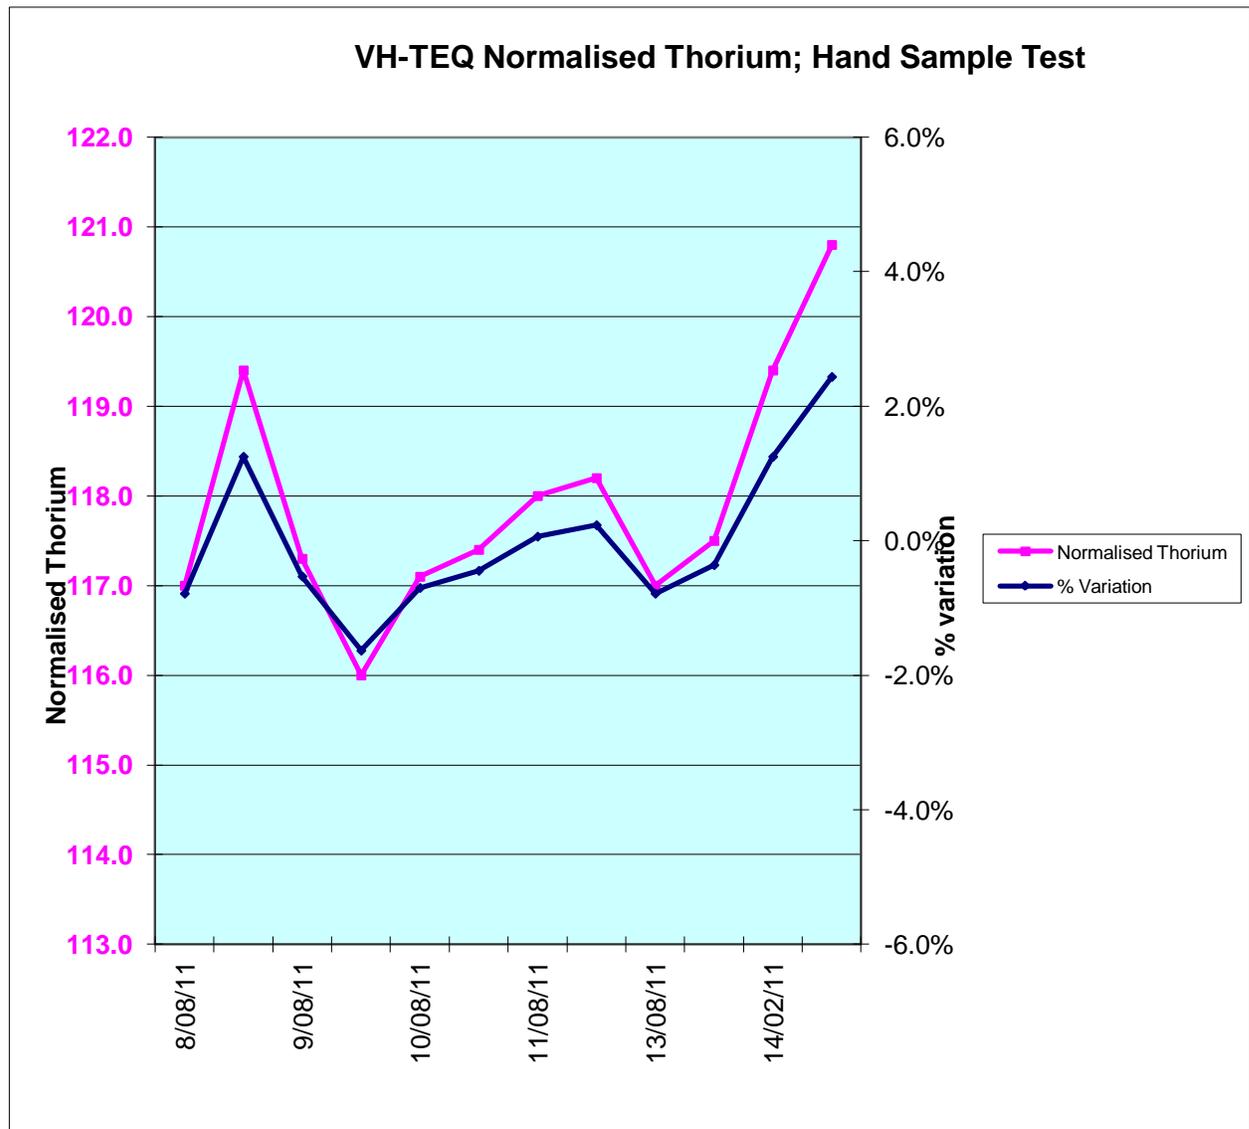

Boundary Lines Used

## CALIBRATION

The radiometric system was calibrated using Geoscience Australia's calibration range in Carnamah, WA, within 12 months of the commencement of this survey. The following calibrations were carried out before and after each days flying:

- a) Verification of the gamma ray spectrometer system response using hand sample checks. System was exposed to a Thorium sample for a minimum period required to accumulate 10,000 counts in the Thorium window. All background corrected counts fell within a 10% envelope ( $\pm 5\%$  from the mean over the survey period).

A Test Line was flown at the same height as the survey specified height to verify magnetometer, spectrometer and barometric altimeter baselines. The test line was flown over a repeatable line of five kilometers and was flown in either direction. The test line Thorium window counts fell within a 10% envelope (+/- 5% of the mean over the survey period).

Prior to the commencement of the survey, a parallax check was flown to verify the correct parallax values for all of the recorded parameters.

### HEADING CHECKS.

A series of lines were flown to check the magnetic heading of the aircraft at the end of the survey  
Two lines were flown North- South and two lines flown East- West

To review this data, intersections were calculated at of each of the cross over points, the lines did not cross over the same point, which is nearly impossible, and Diurnal was not collected on the day and was not removed. As the lines were only several minutes long and not separated by a large time difference then we can assume that the diurnal was near constant during the time period. The IGRF was removed with the appropriate filed and using the gps height as the height control

Lines 10010 was flown East, line 2020 flown North, line 20030 flown South and line 10040 flown West

From the analysis we computed the following results:

Line	Valid number	Heading crossings correction
10010	2	1.28
10040	2	-0.69
20020	2	1.75
20030	2	-0.73

## RADAR ALTIMETER/BAROMETRIC ALTIMETER CHECK

### VH- TEQ

Radar Altimeter (metres)	Barometric Height (hPa)	GPS Height (metres)	$H_{\text{gps}} - H_{\text{radalt}}$ (metres)
97.59	1375	97.2	-0.39
141.26	1364	141.23	-0.03
191.42	1357	187.3	-4.12
235.17	1352	236.5	1.33
281.37	1346	280.44	-0.93
330.69	1344	336.55	5.86
380.5	1337	375.2	-5.3
441.16	1333	441.6	0.44
486.41	1326	487.36	0.95
505.84	1322	506.35	0.51

### IN-FIELD VERIFICATION AND PROCESSING

Stringent real time data validity checks were employed. Thomson Aviation conducted a daily post-flight verification of all acquired data. The following products were generated on site by a mixture of ChrisDBF and Thomson Aviation proprietary software:

- 1) Flight path plots, to demonstrate quality of navigation
- 2) Magnetic stacked profiles, to demonstrate character of magnetic data
- 3) Statistical summary of line data
- 4) Magnetometer base station plots
- 5) Progressive image presentation of magnetic and topographic data
- 6) Plots of daily parking site of the aircraft to verify GPS position.

## NAVIGATION AND POSITIONING

Navigation was by electronic means using a mobile Novatel OEMV-1 VBS receiver to provide flight guidance to the pilot as well as recording the flight path for subsequent processing. Differential GPS data was obtained in real time using static GPS data obtained from the "Omnistar" wide area GPS service. Position relative to the survey line was displayed to the pilot by a system proprietary to Thomson Aviation which has proven highly effective.

Under normal circumstances differential GPS is expected to yield positional accuracies in the order of 5 metres RMS or better.

## DIURNAL MONITOR

The base station magnetometer was positioned at Redbank copper mine. It recorded to a sensitivity of 0.1 nT every 5 seconds. Noise levels on the base station magnetometer did not exceed +/- 1.0 nT and the non-linear variations of the diurnal field did not exceed 10 nT in 5 minutes.

## DAILY REPORTS OF AIRCRAFT VH-TEQ

See Appendix A

## AIRCRAFT AND SURVEY INSTRUMENTATION

### AIRCRAFT VH-TEQ

Our PAC750-XL, VH-TEQ was used as the survey platform. This aircraft combines good maneuverability with the benefits of a magnetically clean base for minimal interference with the magnetic performance of the sensor. The PAC750 is designed specifically to be flown at very low altitudes due to its agricultural background.

**Details:**

Engine	PT6-34 Turbine
Fuel Type	Jet A1
Fuel Burn	180 lt per hour
Cruise Speed	155 Knots
Survey Speed	145 Knots
Stall Speed	60 Knots
Total Time Airframe	500 Hours

## SURVEY INSTRUMENTATION

### MAGNETOMETER AND COMPENSATOR

The Geometrics G822A Magnetometer is a highly sensitive unit incorporating an optically pumped sensor. The constant harmonic frequency from the sensor is proportional to the surrounding scalar magnetic field. This frequency is resolved by the Counter / Processor which provided the magnetic field to a nominal accuracy of 0.01nT at 20 times per second both in analog and digital forms.

The sensor and pre-amp are stinger mounted, attached to the rear of the aircraft.

A Pico Envirotec MMS-4 processor was used to correct, in real time, for the magnetic interference caused by the aircraft itself and the effects of it maneuvering in the earth's magnetic field. The signal from the magnetometer is preserved without aliasing or phase distortion. The raw uncompensated data was also recorded.

### RADAR ALTIMETER

A King KR 495B Radar Altimeter was used, this unit is a high resolution, short pulse ratio altitude system designed for automatic continuous operation over a wide variation of terrain, target reflectivity, weather and aircraft altitude. The radar altimeter indicator provided a terrain clearance display from 0 – 650 metres (0 – 2,000 feet) above ground.

### BAROMETRIC ALTIMETER

Barometric pressure was recorded using a Vaisala pressure transducer with a range of 600 to 1600 Hpa and a resolution of 0.04 Hpa (equivalent to 0.4 metres). The sensor was calibrated to the height given by the GPS.

### DATA ACQUISITION SYSTEM

The GeOZ\_DAS digital data acquisition system recorded all system parameters to removable Flash Cards and provided both pilot guidance and error reporting diagnostics for the pilot or operator. Data was transferred to a field computer for both verification and archiving prior to being shipped to the processing centre.

## NAVIGATION EQUIPMENT

The GPS receiver was a Novatel OEMV-1VBS 12 channel parallel tracking receiver capable of providing sub-metre resolution at five times per second. The GPS receiver was integrated within the GeOZ-DAS acquisition unit.

## BASE STATION MAGNETOMETER

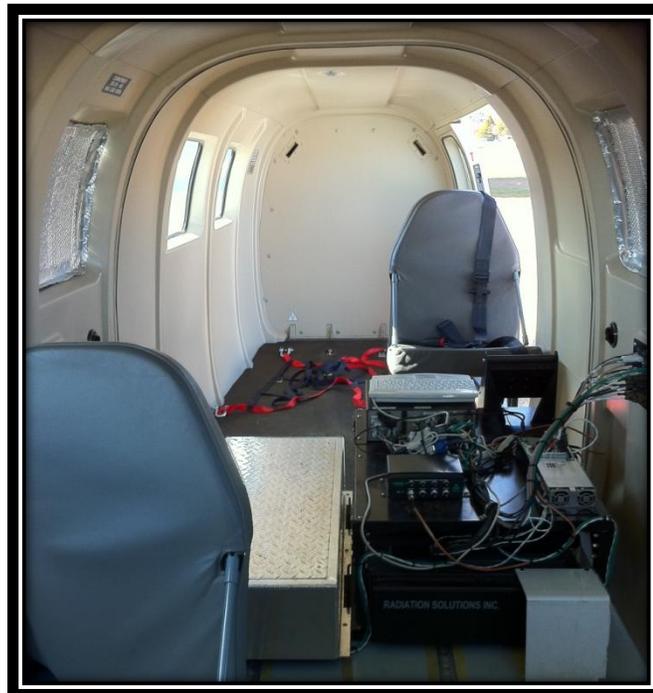

Two Geometrics G-856 magnetometers with analog and digital recording were used as diurnal monitors and run continuously during the survey periods.

## GAMMA RAY SPECTROMETER SYSTEM

Two Radiations Solutions Inc. RSX-4 Gamma detector systems delivered high-resolution spectral information from 0.33 MeV to 3.0 MeV. In addition, the five primary regions of interest; Total Count, Potassium, Uranium, Thorium and Cosmic were provided. The Gamma Ray Spectrometer was interfaced to a NaI (TI) crystal detector pack with a total volume of 33 litres (2048 cubic inches). The detector packs embody the latest techniques whereby the elimination of dead time in the counting process yields up to 30% more counts over competing systems.

Superior calibration facilities included the visual real time monitoring of full spectrum data and in flight monitoring of gain drift relative to the selected isotope window, to ensure that long-term data quality was maintained.

Enhancement of the spectrometer data was achieved by noise reduction techniques (NASVD or MNF), followed by dead time correction, energy calibration, cosmic/aircraft background correction and atmospheric radon removal all applied to the 256 channel data. Spectral stripping, height correction and conversion to radio-element concentrations were then applied prior to gridding and microlevelling.
