| Job Location | Job Description           |
|--------------|---------------------------|
| Bachelor NT  | Proposed drilling program |

Lease area is essentially located in a north/south direction extending from the south east boundary of Litchfield National Park to Camp Creek in the south.

The lease area encompasses numerous types of land holdings ranging from lease hold to individual freehold parcels.

Assessment of the lease area for proposed initial drilling operation was conducted early 2018.

Drilling would be RAB or RC dependent on rig availability. Sample intervals will be at one or two meter intervals.

Initially drilling operations would be conducted within the northern sector of the EL on three lines with a east/west bearing and straddling the deposit area (Ridge)

Each line will comprise of three holes drilled to a maximum of 50m and positioned central to the top of the ridge with one hole on either side of the ridge. Subsequent infill holes may be placed pending results of initial drill holes.

Location of the three initial drill lines will be placed in the immediate vicinity of the original grab sample locations with a fourth possible line places on the south side of the grab sample area (see Attached map)

Sampling and drilling will progress towards the south of the lease area pending negotiation with land/lease holders.

It is likely that the drilling of these areas will be conducted over extended time within individual drilling campaigns.
